Thanks for the response!

Kansas City is about 20 miles from and it would have been fun to play with
the trunking. They do
however generate a lot of chatter.

I really bought the scanner for rural county police,
Hwy Patrol, Aircraft, some HAM.

So I'm not terribly disappointed.

It was an upgrade from a BC800XLT thats been in mothballs for some years.

Just thought I'd reactivate an old hobby.

The computer control interested me.

Anyway, thanks to all for the help, I'll be seeing
ya around this group

Carl

What's the URL for the Michigan state police license application? Better
get me one.

Thanks.

Try www.sunnbattery.com in Jacksonville Florida if my memory is correct. I got the Icom clone BP-84H which has served me well for over a year and holds a great charge for use with my Icom IC-2SRA (wideband scanner/2 meter transceiver). I think I paid less than $30 for it. Would not hesitate to purchase from them again. They can supply almost any battery need you might have. Pat, K4AVO

I thought I was up to date on this stuff, but I just caught a show on TLC, City Spies, about surveillance cams, etc. About halfway through, they had this guy who was using a portable (not handheld) scanner tuning into cordless phone calls. No big deal, but the rig he was using looked way cool. It looked about the size of a 895XLT, but the button layout was different, and the display was black with amber LED or backlit LCD segments - the reverse of an XLT, and the characters were much crisper and bigger. They showed it a bunch of times, but the camera was zooming in and out of focus so much it was tough to get a long look at it. This rig doesn't look like any commercially available piece of gear I've ever seen.

It may not have been a scanner, but rather a piece of Telecommunications test equipment, something used for DF, or RFI location. Some really nice stuff, such as found at:

http://www.jensentools.com/product/group.asp?parent_id=11980

is available, but rather pricey.

Ed

Ohio has just ruled that the police are allowed to search anyone's car
without their permission.

article at:

http://enquirer.com/editions/2002/04/04/loc_ohio_court_expands.html

9. court rules hidden police cameras are allowed in restrooms.

Newsgroup: rec.radio.scanner
Date: 2003-01-01 04:29:31 UTC
From: hiker5@webtv.net
Message-ID: <4517-3E126EAB-10@storefull-2255.public.lawson.webtv.net>
Source record: 39194

Ohio has just ruled that it is legal for police to have hidden cameras watching people in public restrooms (and the police videotaping them).

This puts Ohio at odds with federal law U.S. Supreme Court rulings guaranteeing privacy in public restrooms. and "federal law supercedes state law" so Ohio is overstepng theiautoiy.

but "states' rights supercede federal law according to the constitution. Any power not given to the government by the constitution is given to the states" so the Supreme Court is overstepping theiir authority.

hmmmm..... (regarding the above)

Police hid the cameras in public restrooms to watch people, and then charged them with "public indeceny"

One of the charges was because one of the men stepped a step back away from the urinal before fastening his pants. The police ruled that stepping back from the urinal before fastening your pants is "illegal pblic sexual conduct".

hmmmm... I never knew that was considered sexual conduct, let alone illegal. I always step back a step or two from the urinal before fastening my pants. otherwise, you would get what's in the urinal from other people all over your pants. yech! But I guess the police don't consider that one "illegal sexual conduct" since you didn't step back first.

<well .... If i switch on my shortwave set, I can <hear and speak to all of those languages. If i <turn on my TV I can find channels where I <dont have the faintest idea what they are <talking about.

Actually, in the late 60's and early 70's (and probably before), several main stations in major cities (such as in Ohio) were "ethnic" stations , with broadcasts in several different foreign languages.

And even the main popular stations had "ethnic programming" (foreign-language) programming on weekend mornings.

these were not shortwave stations, but were regular AM and FM radio stations.

Of course, back then, AM was more popular than FM.

then sometime in the early 70's, the stations (both AM and FM) started switching to all English-language. Especially the FM stations started switching to all English-language then.

19. police to charge money for listening to their transmissions on a scann

Newsgroup: rec.radio.scanner
Date: 2003-01-01 07:28:11 UTC
From: hiker5@webtv.net
Message-ID: <4516-3E12988B-78@storefull-2255.public.lawson.webtv.net>
Source record: 39103

some months ago, I think within the last year or two, it was reported in the newspaper here that a certain Ohio county's police department who has switched to 800 MHZ and digital is going to allow the public to listen to their police calls on scanners as long as the individuals pay money to the police department for the privilege of doing so, (liscened by the police department).

the scanners the people will be listening on at home or mobile, are not provided by the police department, but are scanners each individual person buys theirselves at the regular places they buy scanners from.

No one around here thought anything of that article, until yesterday when I came across some site or newsgroup message on the internet that claimed that the police are not allowed to charge money to individuals of the public to listen into police transmissions on their scanners, since it is "public service" transmissions.

from the article, it's my understanding that since the new transmissions are digital, and each individual of the public will need a digital-capable scanner to recive them, that the police can lock out certain scanners from receiving the transmissions until that individual pays the money to the police department for the privilege of listening into the police calls, and getting a liscence from the police department to do so. where the poliice will then send the appropriate codes to the appropriate scanner(s).

I don't have a link to the article as this was in the printed newspaper here. (a reputable newspaper, the major newspaper here).

and I forgot the link to the site that said they're not allowed to do this.

However, they really are planning to do this.

From: Harry <marnells@cox.net>
Message-ID: <MjyQ9.13171$L61.1287103@news1.west.cox.net>
Source record: 39105

Can you find the article... what agency/county is this???

That's either crazy or a HUGE miscommunication... or both. If the broadcasts are going out on the airwaves and receivable by regular - or the new digital - scanners, the police have no way of "blocking" reception or only allowing "subscribers" to listen. It's not just that they're "not allowed" to do it, but it can't be done (except possibly for encrypted or some nonAPCO digital mode.

Digital communications in a technology other than APCO-P25 might require a radio specifically "programmed" to receive it, and some police agencies have reportedly provided or sold those to the media, but plain old analog or APCO P-25 is open to anyone with the scanners. If an -off-the-shelf scanner can receive the broadcasts the police have no way of restricting who can listen.

There's gotta be either more or less to the story... can you find it and provide it, we'd be curious. Every agency that goes to trunking or digital seems to be under some misconceptions about who they can "hide" their radio broadcasts from.

Even Dr Scott admits that the Bible is so watered down that it makes
pablum look like a Mexican feast. The Santa claus story is a perfect
example of how the story of a real person, Bishop Nicolas of Myra in
Turkey, (d)evolved into St Nicolas and eventually Santa Claus, and
eventually got mixed up w/25 Dec. rather than 6 Dec. commemorating his
death, since Father Xmas evolved out of Saturn for Saturnalia, and he got
confused w/Santa Claus.

It requires you to have Adobe Acrobat as it's a PDF file, but here's the
link... Click on Forms. It will be the second form from the bottom,
"App/Short Wave Permit - In Vehicles to Monitor Police Frequency."

Check out the rest of the site as well, has good info about the Digital
comm. system and what they are doing to it, etc...

Can anyone recommend a good antenna for a PRO95. Both mobile and to replace
the portable antenna. I only listen to 800 trunking in my area.

If the transmissions are ENCRYPTED then the department could control who monitors. Now if this is legal or not I do not know but the department then could charge for the "code" to decode the transmission. The only problem is that NO off the self scanner will be capable of encryption, the user/patron would have to purchase a radio similar to or the same as the agency. This would insure that the agencies tactical/operations frequencies would remain private and only the day to day transmissions would be monitored. I guess the same would hold true for non APCO-25 systems such as MA/COM OpenSky.

Yeah, OK. Which newspaper reported this? It should be possible to contact the
paper for a copy of the article, or perhaps the paper has a website with
archives.

>the scanners the people will be listening on at home or mobile, are not

So, what you are saying is that this police department is setting up some sort
of system that is not unlike a cable or satellite TV system. Perhaps there will
be a few programming packages to choose from, and a premium will be charged if
you want to listen to the dog catcher or sanitation department.

>I don't have a link to the article as this was in the printed newspaper

It merely brings the parameters of a search within USSC guidelines
instead of Ohio guidelines. This ruling has been around for YEARS.

I guess my question beyond this from reading the article....

The suspect was behind on child support payments, but had enough money
to buy 25 grams of cocaine????

This decision doesn't say that the police can search "anyone's" car without permission. It says that an arrest gives the police probable cause to search a vehicle. The validity of the search will of
course rest on the validity of the arrest. And no, a traffic ticket is not an "arrest" for search purposes.

Florida CAP (Combat Air Patrol) flights are active today. Callsigns VIPER ## working CAP over Orlando. Callsign TANKER ## also in the area as refueling support for CAP flights.

Tune to 265.4000 MHz for the action. VIPER is also working Jacksonville Center on 134.0000 (Daytona Beach RCO).

This is a real good chance for those newbies to MilAir scanning to hear some actual comms. Also those who just got new scanners for Christmas have fun.

Are you sure the e-mail actually came from AES? I'd make a phone call
to confirm that this is their policy and that it really is an AES e-mail
and fax address before sending anything.

One idea is to get the Radio Shack mobile mag-mount, and then get the
largest piece of sheet metal (steel) that you can get thru thru attic
door to use as a ground plane. If space is limited, get the largest
cookie sheet or baking pan that you can find at Wal-Mart.

Jeff

After filling any "pre-orders," will you be getting enough to sell more of them? I'll post your info on my website http://www.snowcrest.net/marnells/digital-scanner.htm as soon as you've got them on your shelves. According to my unscientific poll on that page, there are at least 112 people out there ready to buy when they hit the stores or some reviews come out. And that's from just the handful (232) who've bothered to reply.

Yes, Uniden dealers will be carrying the digital scanners. Rumor has it that they will be at SOME dealers as early as next week. The "Ham Station" says they will have the 250D handhelds - and the "APCO cards" by January 7th, and they expect to have about 40 units left over after filling their pre-orders.

Tracy Justus has been keeping track of the online dealers at his terrific site at
http://www.freqofnature.com/pricewatch/index.html

I've been trying to keep track of all the rumors and press releases at my pge at
http://www.snowcrest.net/marnells/digital-scanner.htm

Hope that helps!

Radio shack has a variety of scanner antennas.

But, check out the Pro-95 using just the antenna
that came with it. I've taken it in the car, and it
works fine for me on 800 MHz there.

I do notice that the provided antenna is not so
good for lower frequencies, such as air band.
A longer antenna helps a lot there.

46.61 to 46.97 MHz is also used by wireless intercoms, baby monitors and 'toy' walkie-talkies (the old-skool kind). When I was living in Minnesota a few years ago, my neighbors had a baby monitor that used that band and I was able to eavesdrop on pretty much everything that went on in the house. Kids nowadays carry around those FRS band walkie-talkies, they're popular for chatting in-between classes at school.

I tuned to 145.800 MHz in Calgary, Canada and all I seemed to get sounded like cab drivers saying numbers and street addresses. My scanner has triple conversion so it can't be intermod. How much power do you need to talk to the space station? Can you do it on a handheld? I am stll working on getting my ham license and of course I don't intend to try anything until licensed. TTYL

Quting some prices from the web page:
$200 for a 75 to 50 Ohm matching pad
$200 for a 20 dB attenuator
$200 for a 20 dB attenuator
and
$35 for a "F" to BNC adaptor,
I wish I could get the bid on selling these items at these
prices. I could retire. If the radio is as overpirced as the
accesories, it might well be a real dog.

Alright, thanks. I got one scanner now that does CB Police, 900mhz
1ghz-1.3ghz, CB, weather, Aircraft (havent picked up anything on this
yet) marines (Havent picked up anything again.) and ham. I though no
scanner had a range like that though.

Could be either. "Digital" mode can be used on any police frequency.
Some agencies are switching to digital as they move to other frequencies
(such as to 800 MHz), while other departments are staying on their
long-time existing frequencies (such as LAPD) but simply switching from
analog to digital.

What city/county are you talking about... I may have info for you
specifically about them

The number of conversion stages has nothing to do with intermod. Intermod is
the mixing of two frequencies that sum or difference to your input
frequency. This takes place in any non linear component in the front end of
the receiver. You may eliminate them with a bandpass filter that will not
allow the offending frequencies to get to the input stage of your receiver.

Check out

http://www.strongsignals.net a great scanner resource.

As far as a log sheet is concerned, use a computer spreadsheet like Excel
and put in what ever data you want to keep track of. There are probably
some pre done sheets out there but you learn best by doing it yourself and
revising.
I personally do no log scanned channels since I do little seraching. I
simply program what I want to hear and listen away.

Not bad, but you really need to reevaluate your data table. The damn thing is like 5 screens wide on my 1152x864 screen resolution. I can only imaging what it looks like on an 800x600 resolution. It must be close to 10 screens wide... NOT a good way to lay out a webpage... Aside from that, it looks to have a lot of valuable information...

Message-ID: <4g671v4t8iv8iokl7gip2pn6p810g7afnc@4ax.com>
Source record: 39055

It sounds like you want to watch UHF channel 33 or somewhere around 33... A beam antenna (called a Yagi after the japanese inventor) with even just 5 elements can produce amazingly clear pictures, where a regular tv antenna (for ch 2thru88) only get marginal or no signal. The antenna will also pick tv channels very far away from ch 33 very well also.

The dimensions for 550 mhz will be as follows.

reflector 5.3 inches long 4.5" behind driven element
driven el 5.25 inches long
director1 4.7 inches long 2.5" in front of driven el
director1 4.7 inches long 5.2" in front of driven el
director1 4.6 inches long 10.75" in front of driven el

Use an old tv antenna for the boom and some hardware. Drill holes thru the 1" square tube of the boom to mount the elements at the required center to center spacing. Stake the elements in place with a punch so they dont slide out. The beam will be about 3/4 meter long. Keep some 1" square tube at the back of the antenna for mounting purposes.

All elements are about 8mm or about 5/16 inch. The 3/8" tv antenna parts work ok. You'll need to set up a gamma match on the driven element to attach the coax to the antenna with a proper feed point impedance more or less. Do a search on Google groups and look for info and tips on building a gamma match. All you need is some coax, a short tube to slide the coax center foam into, and some mechanical aptitude to build it.

Good Luck

I monitor many law enforcement transmissions in the eastern part of Virginia. Approximately twice a month I will hear a State Trooper or city or county police call the dispatcher asking for someone to come on scene at a traffic stop because the driver speaks no English. How in the hell can he get a driver's license(assuming he did)? If they don't speak English then they do not understand our traffic signs and directions. If that doesn't scare the hell out of you, I don't what does. It is a 50 state problem, not just in Va. When I lived/worked in Germany, it was MY responsibility to learn whatever German I needed to when driving. The same applied to France and Spain and other countries in which I drove. I did it for self preservation. I wanted to leave those countries alive and uninjured.

If you are referring to Amateur Electronic Supply, I have ordered a number of items from them over the years with no problem. I don't understand why people order through the internet when they don't have to. Call their 800 number and order by telephone. It's not 100% foolproof but it is better than having the credit card information sit "butt naked" on a server at risk to being hacked. Speaking of that, my Ebay credit card information was stolen from Ebay 3 years ago when I sold an item. I had no choice in that situation. I had to provide it to Ebay via the internet.

Or were there any Bowl games in Florida today? Thay might have been up there
to provide protection/security for the stadiums.

What do you mean by "pickup"? I have video monitor with a 2 ghz. scanning circuitry built in. It detects the signals. The only problem is the signals are all digital and I can't hear a one of them. But they display a pretty pattern on the video raster.

You're right. I had not even thought of that. The Orange Bowl is in
Miami still. Same with Citrus Bowl? So homeland defense is alive and
well, I suppose.

Worked didn't it DeWayne. And yes I do read the subject line.

Don't be so rude by assuming.

And by the way, I don't cross post.

80. Hobbyists can now listen to police on digital radios

Newsgroup: rec.radio.scanner

By JASON STRAZIUSO : Associated Press Writer
Dec 31, 2002 : 4:36 pm ET

PHILADELPHIA -- Hobbyists who listen in on police chases or ambulance runs with scanners have been frustrated in recent years as emergency departments increasingly switch to digital communications. For them, Tuesday brought some good news, as the first consumer digital scanners shipped to retailers.

Rich Wells said he would soon buy one of the new $300 handheld radios but would likely hold off on paying another $300 that would grant access to digital communications. He said many enthusiasts, though, won't hesitate to spend the $600.

"Most serious people that listen to scanners, they own several different models and are used to spending several hundred dollars a year," said Wells, 36, who runs a hobbyist Web site from his home outside Raleigh, N.C.

Public safety departments and even some non-emergency city departments are increasingly replacing aging analog radios with digital units, which promise clearer transmissions and interoperability with other departments. Interoperability was an issue that surfaced after the Sept. 11, 2001, terrorist attacks when police and fire units responding to the World Trade Center had trouble communicating.

Michigan state police in October finished installing a $200 million statewide digital system. The system led to the apprehension of a person fleeing from Grand Rapids to Detroit because police could easily communicate, a spokesman at the Michigan's Public Safety Communications System office said.

Even with Tuesday's shipment of Uniden radios, some hobbyists -- and drug dealers and tow truck drivers, too, police point out -- still won't be able to listen everywhere. Michigan, for instance, uses a system the new consumer scanners can't pick up. Uniden expects to have a unit that will pick up the majority of signals by late 2003, said Scott Carpenter, a products manager for the Fort Worth-based company.

The Philadelphia police just before Christmas converted from analog to digital at a cost of $52 million. The department now has 3,400 digital radios, said Deputy Police Commissioner Charles Brennan.

Philadelphia still transmits in analog, but will probably switch solely to digital by February, Brennan said. He said the switch hadn't yet been made out of consideration for neighborhood watch groups and news media

that monitor police scanners.

"All we want to do is make sure that (the new radios) do what they say they'll be able to do," he said.

It's unclear exactly how many emergency departments nationwide have switched to digital systems, but it is the trend, said Ron Harafeth, a director of Project 25, an offshoot program of the Association of Public-Safety Communications officials. The 12-year project created the technical standards behind the digital systems.

"A lot of federal agencies are mandating Project 25 for any new implementations. That's going to drive what happens in rest of local government," he said. "There's a big push for compatibility and interoperability."

Actually the CAP was flying around the Orlando Fl area. During on of
the refuel trips to the tanker a CAP (combat air patrol, not Civil Air
Patrol) pilots make comment of watching the Penn State game from 22,000'
. That would have been the Capital One Bowl.

I believe it's a huge miscommunication.

It sounds like he's referring to something like what our own local
Gainesville, FL utilities dept. did when our own public service
agencies went to digital...

They were aware that Press and other people would not be able to
monitor. But, if anyone DID want to monitor, they could "rent" a
digital-capable RADIO (with transmit disabled) for $200-something
bucks per MONTH. The radios have only ten channels, and scan SLOWLY.

So, if you look at it his way, then yes, they're "charging" to
listen ... but I'll bet not in the way actually indicated in the
original post.

They get off on a "technicality." See? ...They're charging for the
rental of the RADIOS, and not for the "right to listen to a frequency
or band."

Todd

I sure HOPE so, but none of the thre current online "netcasters" around L.A. has said they're gonna be doing it. One, in fact, said when he gets his new Uniden he's gonna be using it for his own listening and NOT for an internet feed. At $600 per "set," I doubt many will rish out to get the thing just for the rest of us to hear.

86. Re: Space Station Today!

Newsgroup: rec.radio.scanner
Date: 2003-01-02 10:30:26 UTC
From: Pat Cox <peacox@gloryroad.net>
Message-ID: <3E1414C2.9BD05EA8@gloryroad.net>
Source record: 39069

You are in a highly congested urban area I assume. Try it on your next visit to the countryside. Yes handi-talkies and handheld scanners can and will do the trick. Just remember, in UHF-VHF radio the antennas must electronically "see" each other. That means the shuttle or station must be above the horizon and the two antennas "see" each other with nothing in between. Signal increases in strength as the vehicle moves toward you and decreases as it moves away, the Doppler effect. It is fun and fascinating. Pat, K4AVO

I'm looking to purchase a Diamond Discone (model D-130J) antenna. Found one for $79.99 + S&H

Is there a lower price out there?

TIA,
Vic

How do I program fleetmaps?
I entered & got the MA State police working in the trunking...it switches ID's,etc...on the MOT mode. My question is what's the reason for having a fleetmap? if I can get the trunking working without it?

Please reply here or e-mail me: FLYFISHINGPI@aol.com

I have one as well I'd like to part with...1991 CPU mounted in a 1994 chassis with extended memory and nice backlit display. Never cell blocked, not a modified radio!
Will include a manual...and I am only asking $125.00 including shipping to USA, APO or FPO addresses.

94. Search mode on Uniden BC140 ???

Newsgroup: rec.radio.scanner
Date: 2003-01-02 16:24:48 UTC
From: JFR <jfr.mail@club-internet.fr>
Message-ID: <av1p8aojq1@news-reader11.wanadoo.fr>
Source record: 39078

Hello,

I've just a question about the Uniden Blackcat BC140 : is there a "search mode" ? It seems not, there is no key "search" and it seems it's impossible to sweep a range : only programming and scanning programmed channels seem to be allowed.

Am I right or is there a combination key to make it search ?

Many thanks and happy new year !

JFR (France)

Source record: 39079

Fleetmaps are only for Type I systems.

If your TRS is a type I system some or all of the talkgroups will be listed like this:

300-01 Sample Talkgroup

300 is the fleet and 01 is the subfleet. These will usually also have the Uniden Trunktracker fleetmap specified somewhere, for example E1P4 (meaning Type I, Preset 4).

If you use Don's software, you can select these presets and the software will take care of the rest. If not, you'll have to specify each block yourself. The manual has a chart you can look them up with, or you can use Don's software to look them up as well - just open the software and choose a preset from the fleet map pulldown.

HTH,
-me

102. Wanted - Scanner

Newsgroup: rec.radio.scanner
Date: 2003-01-02 21:00:02 UTC
From: Dave Schmidt <REMOVE_THIS_n9nlu@charter.net>
Message-ID: <v19af2r6o8f8b4@corp.supernews.com>
Source record: 39086

Lets try this post again ....it didn't go through on FOUR previous posts.... damn computers!

I'm looking for a Base scanner.... BUT ... not one of those table top type units with the display facing up....

Something like a Uniden BC890XLT, 895XLT, 9000xlt, or something similar. Dosen't need
to be a Uniden ...could be a Scrap Shack (radio shack) model or really anything else similar that can do trunk tracking.

Tech specials are welcome ... I.E. it fell off a table and now it dosent work or it had the wrong polarity power aplied, or it all of a sudden went deaf ... etc etc ... if it has a problem ... sent me a note with what you have.

Thanks

Dave

Anyone....

Does anyone out there have any extra info on this scanner. I am rather new at this. Would like to know any available info. Thanks.

Also, I am in the Las Vegas Nevada area if anyone has any freq. they can send.
Thanks again..

Happy New year!

Z

Plenty of programs for free do a search for a ham log or shortwave,
some let you change the heading so you can make up any type of log
book you want

If your going to spend the money, buy the 780XLT, don't waste your money on the 895. I just got rid of one, and don't recommend it.
Go to Uniden's website for more info.

108. Attic mounted antenna

Newsgroup: rec.radio.scanner
Date: 2003-01-03 00:29:48 UTC
From: Mike Burch <mburch46@mchsi.com>
Message-ID: <3E14D926.8EBB3793@mchsi.com>
Source record: 39092

Hi Fella's:

I need some advice. We live out here in Arizona and the roof of our home was constructed with those overlapping tan colored clay shingles, they look like drain pipe cut down the center line and are around 1" thick. I want to put a small Radio Shack 1/4 wave scanner antenna in the attic and maybe one of those Grove scanner beams eventually and all fed with quad shielded RG6. I was wondering if the attenuation through the roof tiles would be so great that putting an antenna up there would be a waste of time. Do any of you have any experience with this? The end height would be around 30 ft. There are HOA nazi's here. :-)

Thank you in advance

Mike Burch K8MB

Apache Junction Arizona

I think it's an excellent project, experiment away!
The clay shouldn't interfere with signals any more than plaster drywall or wood shingles, and if they do a little more, not enough to gripe about.
Besides, the point is to get past the HOA Stormtroopers... and in that situation, SOME signal is infinitely better than none at all.
It's entirely worth trying.

Get a digital scanner if you will need one. They are going to be in the $600 range with the card module. If your area is not digital or not going digital then forget it. A PCR 1000 is still in the $360 range with the new Bonito software. If your area is going digital then check and make sure it is not the 9600 baud type since the scanner coming out will not decode that type of system. That type of scanner is probably a year or more away.

That is not true, it all depends on user level, motion of the cellphone,
etc. At least that's what a little birdie has told me...

The issue then becomes what kind of digital you might get. If you get one of the current digital scanners it may not work with a system your area may get. Figure out what your area has now and get a scanner for that. Some of decent trunking/conventional scanners are fairly inexpensive. The Radio Shack 2053 is on clearence right now for around $130 if you can find one.

>What type of system is the City of Oklahoma City,<

The last time I was over there (it's been a long time) with a scanner it was a three ring circus trying to monitor things there as it was a conglomerate of systems, Mid West City, Edmond, Norman and Bethany are ones that come to mind. They didn't have anything exotic, think most of their systems were down in the 150-155 mhz range.

123. FCC database information

Newsgroup: rec.radio.scanner
Date: 2003-01-03 06:28:06 UTC
From: Richard Dreyfuss <jquimby@hotmail.com>
Message-ID: <Xns92F7EC6C536E2jquimbyhotmailcom@206.141.192.32>
Source record: 39003

Is it possible to decipher what the emission code given in the fcc
database represents, or does it give any useful information? Would "Type
First Use" or "Class: ??" be useful?
This could save some time when searching online. For example, a
hospital near me has 49 frequencies registered to it by name in the
database. I'd love to weed out, before programming the scanner,
frequencies that won't be useful to me (anything not nfm or am in my case).

I'd appreciate it if anybody could point me in the right direction.

Thanks
Ben

Actually it better to utilize the Access databases for that function. If someone is interested in a simple database to effectively log contacts etc. just let me know. I could create one fairly quickly and email it.

One thing I do not like, unless I am not doing something right is the old type of "search" function, where you can enter an upper and lower frequency and the scanner will search between those two frequencies. There is a search function but it seems like it only works from a specific typed in frequency and the scans through out the total range of the scanner.

126. Uniden Bearcat BC 140 Won't Break Squelch While Scanning

Newsgroup: rec.radio.scanner
Date: 2003-01-03 13:32:18 UTC
From: buck <email@domain.com>
Message-ID: <0301200308321897 18%email@domain.com>
Source record: 39007

I have a Uniden Bearcat model BC 140 that recently started exhibiting the symptom of not breaking the squelch on certain (active) channels while in "scan" mode- arying the squelch setting does not make a difference. Stepping through the channels in "manual" allows those chanels to be heard. Other channels break the squelch when the channel is active and the scanner is in "scan" mode.

Any assistance in faciliting this repair would be greatly appreciated.

All of this makes for fine reading, but how is it blocked?

> I'm taking a Yaesu VR-500 so I can do HF/VHF/UHF.
>
> Thanks!

Start out with the Combat Air Patrol Freqs, I have these listed here:
http://www.milaircomms.com/uhf_cap.html If CAP is active you will
without question hear them as most of their flights are centered on
Orlando (gotta keep Micky Mouse safe!)

Now I don't know what type of antenna you'll be using but if you have
the time program in the FACSFACJAX freqs as these are active nearly
everyday, especially 267.5000. The rest of the list can be found here:
http://www.milaircomms.com/uhf_facsfacjax.html

Next could be PineCastle Bombing Range which is about 30 miles north of
Orlando. I don't have these on my website yet but here's the list:

120.9500 AM Range Operations

134.6500 AM Range Operations

139.5250 AM Misc. Net

140.1750 FM Base Operations

140.6750 FM Target Operations

140.8250 FM Fire Department

228.4000 Townsand Rng R-3007

249.8000 Range Operations

253.1000 PINECASTLE ELECTRONIC WARFARE

267.4000 Range Operations
269.2500 Pinecastle??

281.3000 Range Operations

313.1000 Range Operations

321.8000 Range Operations

326.8000 Range Operations

350.4000 Range Operations

357.0000 Ragne Control

359.4000 Target Control

380.7000 Range Operations

380.8000 Range Operations

359.400, 350.4000, 380.7000 and 380.8000 being the most active.

Next would be the Orlando Approach MilAir freqs, here's the list:
251.0750
259.1000
284.7000
307.0000
388.2000
339.8000
351.9000
397.8500
253.5000 Orlando International Tower
273.4500 Orlando International Tower

Also don't forget you're going to be on the border of Miami Center and Jacksonville Center, here are links to both their freqs (however not all that active but you should get a catch or two):
JAX Center: http://www.milaircomms.com/artcc_zjx.html
MIA Center: http://www.milaircomms.com/artcc_mia.html

And of course you'll want some NASA freqs, not sure exactly when you'll be in the area but the next Shuttle launch is 1/16. For the list you can get these here: http://www.milaircomms.com/uhf_ksc.html Pay close attention to the frequencies in Bold as they are the best ones used during a Shuttle or Rocket launch.

On 1/21 at 5:35PM there will be a Titan 4 launched and on 1/29 a Delta 2 launched from the Cape. Most of the bold frequencies will be active for these two launches. If you're in the area during those two dates and want a good location to view these two launches let me know, possibly we can meet over at Port Canaveral's Jetty Park and of course I'll have a few scanners with me.

Give this a try:

Press PGM, then Search.

Enter the lower freq of the range you want to search
Enter the upper freq of the range you want to search
Press search. You should now only be searching the range you want.

Ops I almost forgot, US Customs! Put these three freqs in your scanner:
285.0000
282.4250
120.3250

282.4250 is active almost everyday. If you hear a Call Sign of HAMMER
and OMAHA then you know you're receive US Customs aircraft. You might
get lucky and hear an actual chase up the coast, just had a good one the
other day.....

I've visited the Las Vegas location several times. While in the store, asking questions about various things, I noticed the salesman was a bit short with me, perhaps because he was losing sales to the other salesmen who were answering the phones and my piddly inquiries were not worth his time.

This has happened on more than one occaision. Next time I go to Vegas I will not stop by and find something to buy. (I am an impulse buyer!)

Best regards.

> outside between sessions. ;-)

With that type of Antenna its hard to say what you might pickup up. However without question if your in the WDW area you will hear CAP if its active over Orlando or over KSC. The only bad thing, for those who work during the day that is the best time to hear MilAir activity. Things pretty much die off in the evening unless there is activity at KSc in support of a launch. If you're in Orlando during one of the three launches I mentioned you should be able to pickup the weather recon plane on 126.6500, thats one of my favorite freqs to listen to during a launch. It will most likey be that freq where you'll hear the the first hints of a launch getting scrubbed.

Have fun,
George

And some people wonder how in the heck they would ever fill up a 1000 channel scanner..... Currently I have a database of about 1600 frequencies which I monitor. That list is divided between 9 scanners. And that doesn't include any police or fire!.... Love scanners which are computer programable and with lots of banks.....

Unfortunately 170.875 mhz. and 170.925 mhz. are no longer used at the federal prison at Petersburg, Virginia. The compound prison officers carry only HTs and no weapons. Either the new HTs are all digital or possibly they are using cellular digital. 170.925 mhz. was never used as an emergency channel but used for one on one comms direct to another officer.

155. best antenna for the 885.21 and 885.54 frequencies

Newsgroup: rec.radio.scanner
Date: 2003-01-03 21:46:29 UTC
From: Bruno <mongkon.anousak@skynet.be>

Source record: 39038

Dear All,

I often need to listen to the 885.21 and 885.54 frequencies with my Yaesu VR-500.
I still have the stock antenna, but realize that I need a more sensitive antenna because I have to set the squelch almost at the minimum to hear voices.
What antenna do you recommend me, especially for those ranges?
Thanks a lot,

Bruno

PS: I'm going to order a diamond rh77ca and a smiley super stickII 2m/440 but I'm not sure if they are going to work great on the 800 mhz range...

157. BC780XLT Programming Questions

Newsgroup: rec.radio.scanner
Date: 2003-01-03 21:53:03 UTC
From: Kim Luck <me@there.com>
Message-ID: <ls0c1vgmgq1bpahcrkpqf0nrtjl6ttrd6a@4ax.com>
Source record: 39040

I am new to scanning and programming a scanner but I have managed to get the BC780XLT up and running with many of my local frequencies. My question is about frequency sharing.

The Sheriff in one town and the local PD in town 10 miles away share the same frequency. So when I program the channel, is there a preferred way of doing it for the alpha tag/licenscee to be correct? Or do I just pick the one I want to show up and leave it at that? I think the scanner will reject duplicates.

Also, along the same lines, I live in a border region near three different states. So, I have gotten the frequencies for all five counties around me. But there is much frequency sharing even among the different states. Is there a prefered way to set up the banks to have the scans make sense, i.e, do I put one jurisdiction (PD, FD, DOT) in the same bank, or should I put all of the same service in the same bank (all PD in bank 1, all FD in bank 2, etc)? This will sort of influence the way I create my DB files for import into the scanner.

Thanks for the tips. I have lurked here for a while but I have found many good sources of info here.

If you have a Radio Shack in your area buy the UHF TV yagi antenna and mount it for vertical polarization. I am assuming that frequency range is used for UHF TV there. If not, have someone in the US buy one for you and ship it to you.

It works the other way around too. I work as an airborne traffic reporter and on occasion, we pickup transmissions that sound like they're from "down south" on the CHP freqs. Funny part is, they're even using the same PL tone. I'm hearing this on the same freq's as Inland CHP on 39.260, 39.680 and 39.880 with a PL of 118.8 Hz.

Source record: 39044

Just a quick question about this "procedure". I read Greg Knox's instructions about how to connect the discriminator tap to the BC895. The page is located at http://www.geocities.com/Area51/Hollow/4346/2003_bc895_tap.html is anyone's interested.

I'm curious about how to connect the ground or shield connecton that goes to the RCA jack. Is any metal part of the chassis acceptable or is there a particular trace on the board that should be used?

Also, I have to make up a DB-9 cable to go from the radio to the PC. What are the pinouts from the RCA plug to the DB-9 connector?

Thanks!

I need some help with KCMO talk group IDs. I know about the list at
http://jrstheman.topcities.com/KCMOTRUNK.html.

I have the following questions.

1. I have 1901 as Fire Ops. However, it seems to be a police ID.
Any ideas?

2. I can't identify the following:

1221
1902
0039

3. I have 1324 as "special ops" (presumably PD), but there is a lot
of misc. police traffic. Does anyone have a better tag for this ID?

4. I see that the KCFD has a simplex fire ground freqs starting with
866.4875. However, it lists CTCSS tones for each of these freqs.
Does this mean I can't monitor these freqs with a Pro-95? If it is
possible, are these trunked freqs? (I assume so since they are 860
to 868 freqs).

5. If I haven't programmed in a Talk ID by pressing Trunk when the
scanner stops on that ID, can I manually enter the ID in Win95? If
so, can I find a complete list of PD IDs in Police Call or some other
source?

TIA,

-derek

The roof tiles shouldn't be a problem. Ceramic/clay roof tiles are the norm in Australia and plenty of people put antennas in their roof space with no problems. A bigger problem may be the house frame, i.e. is it metal or wood. If it is metal you will have some serious interference problems from the frame.

The jack I installed came with a grounding lug that was a perfect fit for
the screw attached to the grounding lug on the existing RCA jack. I
installed the lug first, used it to mark where to drill the hole, then
installed the jack there. That was 2+ years ago and the scanner is still
going strong. Any part of the metal chassis will work.

Esco,

Thanks for the kind words...

Be sure and go to your local Radio Shack and get your Scanner
Frequency's book. It lists by state all public scanner freqs.
Everything from Police to airports. Usually around $10 to $20 bucks.
It is an indespensible tool for scanning fun. AND they have a log book
area in the back!

Also, if you scan around 48.000 to like 50.000 you might be able to
find some older model wireless phones being used in you area. (that's
if you got a scanner that doesn't block those freqs. or if you modify
yours to pick those freqs. up)
799.000 thru 900.000 are cell freqs. but are hard to get more than a
few secs now cause most cell phones change freqs every few secs.

Another thing to look into for fun is Mr. Microphone toys. They are
sold as toys but make very effective audio bugs and usually can be
recieved by scanners at ranges up to 1/2 mile. Just buy one and take
it appart carefully and the circuit board and battery should be very
small and easily hidden. (disclaimer: check with local athorities
about legality wink wink)

Good luck,
=JUDGECAL=

Is that stock antenna an "indoor" antenna? If so, then almost ANY
outside antenna you get will be an improvement. Personally I like a nice
discone antenna up about 10 or more feet off the roofline of the house.
The Diamond D130J will do everything you want, plus allow transmit on those
two ham bands you mentioned. It's very broad band and good up to 1300 MHz.

Ed

==========

Lots of times peole will sit in their car somewhere and yak on their phone
in which case there wont be any switching from tower to tower. The ones driving
down a hwy. sometimes can be a pain to follow, depending on how busy
the channels are.

Hello Buck,

Sorry about your problem with your BC 140.I just received one for my collection and I'm surprised : is there no "search mode" ? The only feature this scanner seems to produce is to scan user known frequencies.Do I be right ?

About your squelch problem, some channels break the limit, so a question : do these channels are on the same band (UHF or H-VHF) ? It seems this model has strange behavour on UHF : mine makes strange noises depending on the number of segments lightened ! I'm sure the recveiver drains more power in UHF mode, so in your own model, it can produce difference between squelch levels.This is only an idea...

Thanks and happy new year.

Jean-Fran&#65533;ois Riviere

If they use different CTSS tones, just program them into different
channels with the different tones.

>
> I see you also have an R-5000 - I have an R-1000 and it's a great
> receiver.

Yes I like the R-5000 very much, out of all the received I have or had
its my favorite. I did have an Icom R-71A and that was just about as good.

I use my computer to program all my BC 780XLT's and PRO-2052 and its
great. I use Microsoft Access database do store and orginize all my
frequencies info. Then I can tell Access that I need just CAP freqs for
just FACSFACJAX freqs and it will create a .csv file with frequency,
description, mode (AM or FM). Then I just load my software (I wrote my
own scanner programming software) with the .csv list and tell it which
bank to start programming....

If you've got the time your more than welcome to take a trip to Daytona
and have a look at the shack. I'm about 1 1/2 hour from Disney World...

I had an original 1991 date coded "Patrolman" (cellular never was blocked)
and the front of it was smashed when the vehicle it was mounted inside of
was in a collision. That was in '94...I went to the Shack with my insurance
$$$ and bought the current 1994 version which had cell blocked.
I brought both scanners to a local commercial radio shop and the technician
salvaged everything he could from the original 2026, including the enture
CPU board (the smaller of the two boards) and mounted it in the 1994
chassis. That was fine with me, because now I had the extended memory,
better backlight, and cellular capability!
I took the smashed 1991 rig, brand new 1994 CPU/board, and sold the whole
shebang on eBay after countless attempts I made to rebuild the thing.
End of story.

184. Newbie Questions On Trunking, & New Uniden Scanner ?

Newsgroup: rec.radio.scanner
Date: 2003-01-04 13:44:36 UTC
From: Robert Rose <rgsrose@tiac.net>
Message-ID: <av6odj$5qj$1@slb1.atl.mindspring.net>
Source record: 38967

Hello,

Brand new at this.

Thinking of buying that new trunking, digital, scanner that Uniden has
(apparently) just come out with.
Have a few very, very, basic questions regarding it, and scanning in
general:

a. are trunked channels always digital ?

b. are there basic, Non-trunked digital channels also ?

c. any trunked analog channels ?

d. if I get it for now Without the digital card, exactly what modes, etc.,
can I hear, and not hear ?

e. Without the digital card, what does this scanner offer over what's on the
market now ?

f. I read that the 9600 capability won't be available until their "next'
model in another year.
Is there much 9600 now, or likely to be ?

Any other comments or thoughts along this line would be welcome.

Much thanks; appreciate it,
Bob

I wrote it in VC++, before starting my own business I use to be a
software eng. Most of my programming had been in C, Fortran and
Assembly (DataGeneral RDOS). So out of all the compilers aviable for
the PC VC++ seemed like the logical one to use.

I have a trunking analog scanner that picks up some stuff - so there is trunked analog. I am waiting a while to buy anything new, however, as I live in the DC area and everyone's going digital. The Fairfax County Police have apparently gone digital AND encrypted. Fiarfax County Fire has some digital and some trunked and some I guess simulcast analog non-trunked for the legacy systems to use.

Short wave, which travels around the world, covers freqs from the top end of AM (1.6 Mhz) to I think about 21 Mhz. The propagation seems to be best for little radios in the 5 -15 Mhz area. So, 40-50 is not that far away from shortwave and bounces off the ionosphere pretty well on occasion. I used to volunteer at an Upstate NY fire house and we were on 46 Mhz, I think. We'd occasionally get spanish that we guessed was bouncing from Mexico.

189. Re: Cities outlawing mobile scanners? Kansas City

Newsgroup: rec.radio.scanner
Date: 2003-01-04 16:21:26 UTC
From: derek ward <XYABderekward@kc.rr.com1234>
Message-ID: <aa2e1vc7uediba0uja16ketqmm6bc30j64@4ax.com>
Source record: 38972

According the online charter and code of KCMO (www.kcmo.org):

Sec. 70-853. Prohibited communications devices.

No person shall equip any motor vehicle with any appliance or
equipment which may be operated on an ultra-high-frequency radio
receiving set, or with a communications device tuned, fixed or tunable
to receive or transmit messages on any frequency used by the police
department, or have or use such appliance or equipment in any motor
vehicle in this city, unless such motor vehicle is used or owned by a
police officer or other person whose bona fide duty is to execute,
process, make arrests or aid in conserving the public peace, without
first securing a permit so to do from the board of police
commissioners upon application made to the board; provided, however,
this prohibition shall not apply to amateur radio service transceivers
capable of reception of public safety, special emergency or other
radio service frequencies, the reception of which is not prohibited by
federal law. In any application so made, it shall be shown to the
board of police commissioners that the use of the appliance or
equipment described in this section is required by the applicant in
his business, occupation or employment, or will be available as an aid
in enforcement work in case of public emergency.

(Code of Gen. Ords. 1967, ï¿½ 34.321; Ord. No. 41525, 10-20-72; Ord.
No. 56381, 8-16-84)
**********End Code**********

However, I have serious doubts about whether this city code section is
enforceable. If anyone ever receives a citation for violating this
section, I would be happy to represent them at no or low cost. I love
taking on city hall! :)

I haven't searched any of the other area cities.

Got me .... this is the first scanner I've had that does *not* show the channels while scanning. Guess it scans so fast that the LCD display couldn't keep up with it .. just a guess. When it finds an active freq it will show the individual channel display, but not while scanning.

By the way I *highly* recommend going with the computer programming option with this scanner. Do NOT get the Radio Shack program/cable. It will not work with the 95 (nor most of the later models of RS scanners)

Check out this freeware:
http://www.starsoft.com/freeware/Win95/default.asp

And for the cable:

Does anyone know if the new Digital scanners will pick up the Bucks County Police and Fire Radio and what baud rate is used? Since the new digital scanners will not work with 9600 baud, I didn't want to spend the money now if they are not compatible in my area. Thanks, Ron

194. Sensitivity Of JRC NRD 545 As A Scanner vs A Dedicated Uniden Scanner ?

Newsgroup: rec.radio.scanner
Date: 2003-01-04 18:25:59 UTC
From: Robert Rose <rgsrose@tiac.net>
Message-ID: <av78t5$jv9$1@slb1.atl.mindspring.net>
Source record: 38977

Hi,

Have a JRC NRD 545 sw receiver with their Conveter, and use it for scanning the aero and marine channels as
well as the below 30 MHz sw stuff.

The scanning speeds on the 545 are Incredibly slow. Hard to understand why it's so limited in this regard.
It works, but the speed makes it barely usable as a scanner.

Was thinking of buying a "real" dedicated scanner.

Wondering how the sensitivity and selectivity of the new Uniden scanners, e.g., might compare to the
545 using its Converter ?

Think the aerial would really be the deciding factor regarding any differences?

Anyone have any idea how they compare for these (or any other) parameters?

Bob

Trevose Electronics supposedly has a BC250D on display tracking the Bucks
County system.

You might want to join the PhillyScanner group on Yahoo:
http://groups.yahoo.com/group/PhillyScanner/

<No person shall equip any motor vehicle with <any appliance or
equipment which may be <operated on an ultra-high-frequency radio
<receiving set, or with a communications device <tuned, fixed or tunable
to receive or transmit <messages on any frequency

hmmm... the wording of that law, if taken literally, makes my Casio 2
inch pocket tv against the law in that county, even though it only
recievees the regular tv channels 2 through 69.

It's because of the word "or" right after ultra-high frequency recieving
set.

the word "or" makes the first sentence stand on it's own as a separate
law.

"Noperson shall equip any motor vehicle with any appliance or equipment
which may be <operated on an ultra-high-frequency radio <receiving set.

since a casio tv recieves ultra-hight frequencies (UHF 14 through 69),
they are illegal to have in cars in that county.

I'm not a lawyer. I'm just pointing out possible flaws that I see in
that law, if taken literally.

199. ECPA and cordless phones and kids' walkie talkies

Newsgroup: rec.radio.scanner
Date: 2003-01-04 20:05:50 UTC
From: hiker5@webtv.net
Message-ID: <5271-3E173E9E-281@storefull-2254.public.lawson.webtv.net>
Source record: 38981

some kids' walkie-talkies use the exact sam frequency that cordless phones later decided to use, in the 49MHZ band.

kids know that walkie-talkies are two-way radios and not privatte.

(and therefore, not against ECPA law to listen to)

most cordless phone users, don't know that their phones are 2-way radios, and expect privacy.

(and against ECPA law rto listen to)
so now here's my question:

if my scanner is scanning and just happens to stop on that particular frequency in the middle of a conversation that has already started, how do I know if I am legally listening to two kids talking on kids' walkie-talkies or if I am illegally listening to two kids talking on cordless phones?

there seems to be some very serious flaws in the ECPA laws.

200. AR8000 with Trunker question

Newsgroup: rec.radio.scanner

I am helping a friend get setup with Trunker. His control radio is an AR8000. We cannot find the computer cable (did they come with one?) I see Optoelectronics has the AR8000 to Optolinx cable.

Does the cable from the AR8000 connect directly to the computer or is an interface like the Optolinx is required?

Thanks,
Jon

Good question! I guess it would be fair to say, until your certain that it is in fact a telephone conversation, you could continue to listen, while you evaluate the situation. Are you seriously concerned with getting caught?

It's just another indication of how ridiculous some of our laws are! I honestly believe the law was made to pacify the uninformed, general public, and to convince scanner hobbyist to stop discussing publicly, what they're hearing.

It's quite easy to tell if someone is on a phone or radio. Phone
conversations are seamless. You can hear both parties at the same time if
they're both talking. A radio needs to be keyed up to talk and only one
party can talk at a time. What's so hard about that?

I dont get what the fasination is with "cellular capable" scanners?! The new DIGITAL cell phones CANNOT be heard with ANALOG scanners....so whats the big deal. If you want to listen to something exciting, scan your neighbor(s) who own the high power 900 mhz phones or the other neighbor(s) who are too cheap to buy the new 900mhz phones and still use the 49mhz ones. Either way, I am sure you will get lots of "free entertainment" if you live in a urban area.

Side note- I was excited to hear that a neighbor in Hawaii (when we lived there) whos hubands was away for Army training was talking dirty to some lamer she met in a internet chat room. I ALMOST taped her numerous calls and was TEMPTED to give her husband the tape!

http://www.universal-radio.com/catalog/scanners/2250.html

I recommend these guys (above!) I have done business with them for YEARS and have never had a single problem! I bought a ham radio from them (Alinco) and the faceplate had a few miniscule scratches on it when I removed the plastic faceplate cover, and I called them and they gave me a 20% refund (as best I can recall) ! Cant beat that with a BIG stick!

SHOP FOR THE BEST PRICE! I have seen as much as
a $100 difference!

Here are some others that sell em:
http://www.snowcrest.net/marnells/digital-scanner.htm
http://www.fm2way.com/digitalscan.htm
http://endeavorsonline.zoovy.com/category/racingscanners.new_digital_scanners/
http://www.pepperelectronics.com/sc_uniden.htm

Those are just a few of the www sites selling them.

Press Release:

Date: 1/8/02

Title: Uniden Debuts New APCO 25 Digital Scanner Models

SubTitle: Electronics Giant to Sell Software to Customize Monitoring Experience

Synopsis: Uniden lifts the curtain on its long-anticipated APCO 25 digital scanner models.

LAS VEGAS (January 8) - Uniden America Corporation today unveiled its new digital scanner line for 2002, including the consumer electronics leader's much-anticipated base and handheld APCO 25 digital scanning models. Speaking at CES, product manager Scott Carpenter showcased the new scanner products, underscoring the company's commitment to keeping its customers at the forefront of scanning technology. "Our retailers have been pushing us for a Uniden APCO 25 product for months, and our new BC250D handheld and our BC785D base/mobile scanning unit represent the fulfillment of our promise," Carpenter said. "With the ability to monitor conventional, trunked and APCO 25 conventional and trunked systems these models are state-of-the-art radio scanners.

According to Uniden representatives, the Bearcat BC250D and the Bearcat BC785D models, which are slated to hit shelves in late 2002, offer 1,100 channels, 10 banks and a frequency range of 25MHz - 1300MHz. The BC250D comprises all of the features of Uniden's market-leading BC780 XLT in a

handheld model, plus adds APCO 25 capability and an additional 600 channels. Users of both models must purchase an APCO 25 card, the BCi25D, separately. "We're pleased to be bringing these great Bearcat APCO 25 units to market," Carpenter said. "We expect more big cities to migrate to the APCO 25 digital technology, like Los Angeles did this past year, to ensure agency interoperability among police, fire, EMTs and the like - and we know news organizations, businesses and consumers will want to monitor their signals."

Uniden officials stressed that APCO 25 digital scanning technology simply gives users the ability to monitor the day-to-day activities and signals of standard city and government service departments - but in no way allows users to monitor encrypted signals from national and local security organizations.

In a separate announcement Uniden also announced its plans to market its own easy-to-use scanner programming software, which it is demonstrating in its booth at this winter's annual Consumer Electronics Show in Las Vegas. The software will allow the users of all Uniden scanners with data ports to easily program frequencies into the channels and banks of their scanner.

About Uniden Uniden America Corporation, the North American subsidiary of Japan based Uniden Corporation, manufactures and markets wireless consumer electronic products including cordless telephones, business telecommunications systems, multimedia communications devices, scanner radios, CB radios, FRS, Marine radios and other wireless personal communications products. Based in Fort Worth, Texas, Uniden sells it products through dealers and distributors throughout North, Central and South America.

Looks like you got a radio someone might have returned and the people at rat shack either :

1. did not bother to check the radio when taking back and therefore sold it as a new unit unknowingly

2. did not CARE and sold a used radio as a new one

Dear All,

I would like to try the TK500 software from Bob Parnass, but I'd like to know what cable should I buy to connect my yaesu vr-500 to my pc ?
Is it a computer cable or a "scanner" cable? Is it possible to find that cable in any computer store?
Thank you,

Bruno

226. MURS HT on Close-Out at Radio Shack!

Newsgroup: rec.radio.scanner
Date: 2003-01-05 00:49:20 UTC
From: Bill Crocker <wcrocker007@comcast.net>
Message-ID: <6KSdnY1vXc6SHIqjXTWc3g@comcast.com>
Source record: 38910

Radio Shack has their BTX-127 (Cat #19-1206) "VHF Business Band" two-way hand-held, 2-Watt on Close-Out for ONLY: $29.97/ea!!! This unit used to cost as much as $149.00.

Although this was marketed as a "Business Band" unit, requiring a license, it now falls under the newly FCC designated MURS band. This means you do NOT require any license to operate this on the MURS approved frequencies!

The BTX-127 operates on one of nine programmable frequencies between; 151.625 & 154.600 MHz. Five of those nine programmable frequencies are on the MURS band:

MURS CH-1: 151.820MHz
MURS CH-2: 151.880MHz
MURS CH-3: 151.940MHz
MURS CH-4: 154.570MHz
MURS CH-5: 154.600MHz

The Radio Shack manual only illustrates how to program the CTCSS tone settings, and not channel frequencies. The manual claims you have to ship it to an authorized Radio Shack Service Center, for programming. This is not necessary, as you can easily do it yourself, by changing some simple DIP switch settings, located under the battery. For detailed information on how to program the frequencies, click at the link below:

http://www.phreak.org/radio/mods/btx127.txt

MURS radios will have greater distance than FRS radios! Don't miss out on this great opportunity.

Universal are great guys to deal with but notice they do not yet have the radio in stock, not expecing their 1st shipment until Jan 9th. If you want the scanner sooner and cheaper, check out:

http://www.bearcat1.com/item0005.htm
and http://www.national-electronics.com/unbc.htm

Both are reputable and good to deal with.

Why pay more?

>>>And no, a traffic ticket is not an "arrest" for search purposes.
>> Gary

Actually, in Ohio, a traffic violation contains the "right of arrest."
Since, police are allowed to conduct a "search incident to arrest,"
there is the power to conduct the search if a violation is issued.

monitoring times had an article on monitoring inmarsat a few years
back. basically you need a satellite dish pointed at the satellite of
interest (from the east coast, i think there are 2 visible). you'll
need low noise amplifies, and good quality coax, as well as a receiver
capable of operating in the range where inmarsat operates. i'd love to
do this, but my xyl would shoot me if i put 2 satellite dishes next to
the 75' tower in the back yard...

I would seriously look at ADMS3 for your Yaesu. Has better control over the .rdf format and a hell of a lot easier to use and install. The cable you are speaking of is a RS232 cable with a Com Port connector on one end and a 1/8 stereo jack type on the other. I have seen them in RS but never tried one out. I just bought mine. Trust me on the ADMS3 software. You wil like it. Do a search for it on Google. I think it runs about $40.

Also take a look at the Yahoo groups as there are two available for the VR-500 and one of thm has .rdf files for different area that you can download and install into your radio.

Oh yeah..... get a better ant. too. The rubber duck it came with sucks.

You will need a suitable TTL-to-RS232 level adaptor to connect
the radio to your computer serial port. A direct cable connection
won't work and could damage the radio and/or computer serial port
hardware.

I use an RT Systems CT29A cable, sold for the VR-500.

See the section entitled "Computer Interface Adaptor"
at http://parnass.com/tk500 for more information about
the interface and the free tk500 software.

That's because most scanner users have never had the opportunity to use
such a feature. My Pro 92 comes in handy with this feature all of the
time. Several businesses in my area share frequencies. I can filter
out everyone I don't want to hear, and only get the calls I want. Same
goes for FRS and GMRS. I can keep my scanner on and pluged into AC
power while listening for calls from my family. Only the PL tone I
select is passed, I save on batteries in my FRS radio, and am not
annoyed by the local kids play on their new Christmas gift radios.

(Of course, this brings up another use...Finding the annoying kids PL
tones and breaking in on their "private" channel!)

<Scanner radios are not required to be <incapable of tuning to the
cordless frequencies <because cordless freq's are shared with other
<services that are legal to tune to.

good post and true, however, the cellular telephone frequencies are also
shared with services legal to listen to.

I live in an area of the U.S. that frequently recieves Canadian tv
stations over the air.

some of these Canadian tv stations operated (and still do) between tv
channels 69 and 83

even after the ECPA laws outlawing listening to cellular telephone calls
passed, some of hese Canadian tv stations were still operating between
tv channels 69 and 83, and were recievable free over the air in my area
of the U.S.

watching Canadian tv stations is NOT against the law in the U.S.

therefore, cellular telephones which are illegal to listen to in the
U.S. were and are sharing the band with tv stations that are perfectly
legal to listen to in the U.S.

and therefore, I had a perfectly reason to tune to those channels, if I
wanted to. to watch some tv programs from a Canadian tv station.

however, if the channel I wanted to watch was channel 73, and while
turning the dial, I hear a cellular telephone call on channel 71, it is
a crime under the ECPA laws.

so while the ECPA might not specifically outlaw me from watching and
listening to a perfectly legal tv station to watch, it does outlaw me
from tuning to that legal tv station since I would be able to hear
cellular telephone calls on the oher channels while tuning to that
channel,

and therefore, the ECPA is in practice, effectively outlawing me from
watching a tv station that is perfectly legal to watch in the U.S.

245. Re: ECPA and cordless phones and kids' walkie talkies

Source record: 38928

<Scanner radios are not required to be <incapable of tuning to the cordless frequencies <because cordless freq's are shared with other <services that are legal to tune to.

okay. I just looked it up. (on the internet, not on the tv. I don't even have a tv that goes over channel 69 anymore). and there are no longer any Canadian tv stations on channels over channel69, but there are U.S. translator and/otr low-power tv stations on channels over 69.

but that just strengthens my argument, since it's dealing completely only with the U.S. now.

this means that the cellular telephones in the U.S., which are against the law to listen to in the U.S. do indeed shae the band with U.S. tv stations that are perfectly legal to watch and listen to in the U.S.

therefore, if I go by your argument that is listed above in this post, those cellular telephone frequencies should have never been eliminated on scanners yet, because there are otther services in the same band (on the same channels) that are perfectly legal to watch and listen to in the U.S.

And that's why the cordless phone technology was changed alltogether
(scrambling, higher freqs., etc.). These cordless phone manufacturers
already knew about scanners and were sitting on all this tech until a
few years ago.

I noticed that the VR5000 is now available for $500 (including the DSP unit). Does anyone have experience with this radio? Would appreciate comments, good and bad. I already have a R-5000 (with all the filters) and a RX-320 (which I hardly use) for HF, plus the BC780, BC795 for VHF/UHF scanning. I have 3 specific questions but ould also like to hear opinions in general.

a) Is the VR5000 as good or better than the R-5000 - main interest are utes including digital stuff?
b) Is the VR5000 as good or better than the BC780 and BC795. I'm not worreid about trunking. I do scan most of the VHF/UHF bands. including the milair bands - so I'm interested in its performance.
c) I am particularly interested in trying my hand at some satcom stuff. Not the WX sats but FLTSATCOM, UFO (240-270 MHz NFM) and perhaps the Inmarsats. Has anyone used th VR5000 for this type of stuff and would they recomend it? I would also be interested in any pointers for other satcom that is possible.

I know I'm asking a lot, so TIA.

255. BC-72 vs. BP-84 NiMH

The VR 5000 like many other widebands is a communications reciever and not really meant for scanning like a BC 780. The VR 5000 is a nice radio but a pain to program. It does well across the bands but does not substitute for a good Shortwave like your R5000 or a good scanner like a BC 780. I have no idea how it does on satellite stuff.

My local dealer has it for $500 plus a free DSP, on the spot, no mail in and wait a few months. That is a pretty good deal and if you have an extra $500 it would make a nice addition to your shack but best not a replacement for anything.

Be careful when using a NiCad charger for NiMh batteries.

Most NC chargers use the slight voltage change of a fully charged NiCad
to control cut-off.... NiMh batteries do not have this characteristic
and can be overcharged by NiCad chargers... if your battery is getting
hot, it is being ruined.

NiMh must have their own chargers, or must be used with a dual spec charger.

Bob

That's going to be tough, since August didn't exist as a month until
Roman times...July and August were added to honor a couple of
emperors. (Ever wonder why months 9-12 have prefixes (Sept..., etc)
denoting 7-10? That's why)

Your radio will work as long as you have batteries for it, After the
pole shift, you'll probably need to turn the antenna on its side.

>Confused...

Tell me about it! I'm still trying to work out if the end will really
be on the 21st, or maybe not until the 22nd (Yay! An extra day!) or
possibly the 20th (not enough time to get ready.)

Not exactly. In the pre-Caesars' era, the year began on March 1, so September (seven), October (eight) were accurately numbered. Our "July" was Quintilis (5), "August" was Sextilis (6), etc.

Some Roman mathemetician decided that the year would be more evenly divided if there were 12 months instead of 10, which the Babylonians and Egyptians had already been doing for centuries. So in 45 BC - though of course he didn't KNOW it was "45BC" - Julius Caesar stuck two additional months at the beginning... Januarius (means "gate" or "entry") and Februarius (means "purify," I donno the reasoning). But the Caesars didn't rename Quintilis or Sextilis... that was done by the Roman Senate as a sort of memorial to them after they died.

Scanners will not work on February 29th.

My BC-72 worked fine for the HiMH batteries I used on my Icom 24AT,
including BP-84's and similar. You aren't puitting it in backwards are
you???

Hi Guys,
Such is my love of the AR3000, I have two!! and wish to sell one.

* AR3000/A
* Mint Condition
* User Manual
* Antenna
* 3-Pos Antenna Switch
* External Speaker
* PSU
* Computer Lead
* Assorted PC Software

If you are not familiar with this FINE piece of professional hardware, visit www.ar3000.info where you'll find everything you ever wanted to know including Computer-Control, Software, Mods and Lots More.

I'm open to offers including a part-ex/swap for a decent 35mm SLR. This could include older 70's classics such as the Nikon F series, Pentax M series, etc.

Email me with your offer at offers@ar3000.info

Regards, Tom.

We now need a 13 month year, each month consisting of 4 weeks. This would make life simpler for all the bean counters and those who have to schedule tasks.

I would purpose that the new month be placed between February and March and called "Arbitrary".

January, February, Arbitrary, has a nice ring to it....

And the day should be split into decimal-based increments, rather that
the goofy 60-minute/60-second/24 hours. Be a lot easier to do
conversions and mathematical calculations.

Me too. Never had any problem charging a BP-84 NiMH from Mr. Nicad.
Only battery I used until I sold the IC-24AT. My guess would be a
defective battery. Or is it fully charged? Can't remember what the
manual said about the lights.

I hate to correct you, but what I have seen on many documents from Mexico is
"Estados Unidos Mexicanos", literally, "United Mexican States", could also
be translated as "United States of Mexico".

And why this string is being cross-posted to five different news groups is
beyond me.

275. Re: MURS HT on Close-Out at Radio Shack!

Newsgroup: rec.radio.scanner
Date: 2003-01-06 01:25:03 UTC
From: Jon Van Allen <kf7yn@qwest.net>
Message-ID: <3E18DAEF.C2012AD6@qwest.net>
Source record: 38858

That's Radio Schmuck for you. I had the same problem with the BTX-128 UHF HT. Store #1 had ten of them but the sales droid said he knew nothing of the closeout price and wanted full price.

I went to store #2 who had none in stock so he called the sales droid at store #1 and
had him hold the radios until we got there. Sales droid #1 at first refused to sell the radios to sales droid #2 for the closeout price until a threat of reporting him to the district manager changed his mind. Sales droid # 1 coughed up all ten radios I got my radios and went home. A friend of mine bought the other 8 at store #2.

Some droids have no clue, while others are more than happy to help.

Jon

> Confused.

Wasn't the world supposed to end two years ago? Y2K? The nuts back in the
1970's said Earth wouldn't make it past
the year 2000?

Scanners are worth waiting for, but I'm still waiting for my George Jetson
anti-graviton bubble car, or at least
what the plans are to market a hoverboard to stores so I can get one.

The end of the world. Be there when it happens.

As for the pole shifting, moving to Australia to be upside down will at
least get you to the North Pole.

Guess Santa Claus wil be getting ready for his move, too.

You think THAT's bad... here's an email I got offlist (so I'll leave the sender's name off it...)

" I called 9 stores found one with 3, drove there and
RS moron said he only had 2. I grabbed them, got home and surprise,
EMPTY GD BOXES, everything but radios. Drove back to throttle RS moron
and he called me a thief, talked slower and maintained my temper
he relented.

Lesson 1. Make RS employee unpack & a verify contents

Lesson 2. Stress to the employee that he confirm inventory

Lesson 3. When you find intelligent RS employee get his
card and don't bother going to other RS. There's
a slim chance of 2 informed RS empolyees per
county.

2012 sounds like the end of the Mayan calendar. I listen to Art Bell for mostly entertainment purposes. And I believe Art did hawk Y2K survival supplies before one of his retirements.

Not the buying staples in bulk when they're on sale is a bad idea.

But I think Unix AKA Linux has a calendar function that can give the time between dates. I also
remember that bringing up a certain month in 1683(?) gives only two weeks, since the powers that
be made an update to time and date keeping as knowledge and technology developed.

The only other small wideband under $200 is the Yaesu VR 120D which should be around $120 with the current sale on.
I doubt that you would find it much different than the R2 though, still no keypad.

Small good performer but not a real fast scanner is the Yaesu VR 500 but it is above $200.

From my FAQ article REPAIR TIPS: RADIO SHACK SCANNER RADIOS at:
<ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner/Repair_Tips_for_Radio_Shack_Scanner_Radios>

"...The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp..."

And don't forget, since the Orthodox Christians still don't recognize
Pope Gregory's calendar corrections, they won't see their world end
until two weeks after we do.

Perhaps the fact that the Las Vegas, NV is growing so rapidly (+/-
5%/year) means that the frequencies are needed faster than they could be
allocated in more conventional manners.

It was the only time I remember seeing the green light come on and then
go right out. Maybe the charger is bad, it's not the best built thing
I've ever seen, the smaller power plug wasn't even soldered in when I got
mine!!

What part of 8/13/3113 BC did you not understand? Where's the calculator
that can do BC?

>>>???

I need to calculate the number of days between the Flinstones and the
Jetsons.
The Mayan calendar says the world will end and I beleive they featured
George Jetson in one of their glyphs.

Between 8/13/3113 BC and 12/21/2012

I found this while cleaning out my attic. Don't know how helpful you'll find it to be...

Message from: Rome
October 3, 1 B.C.

Dear Cassius,

Are you still working on the Y zero K problem? This change from BC to AD is giving us a lot of headaches and we haven't much time left.

I don't know how people will cope with working the wrong way around. Having been working happily downwards forever, now we have to start thinking upwards.

You would think that someone would have thought of it earlier and not left it to us to sort out at the last minute.

I spoke to Caesar the other evening. He was livid that Julius hadn't done something about it when he was sorting out the calendar. He said he could see why Brutus turned nasty. We called in the consulting astrologers, but they simply said that continuing downwards using minus BC won't work. As usual, the consultants charged a fortune for doing nothing useful.

As for myself, I just can't see the sand in an hourglass flowing upwards.

We have heard that there are 3 wise men in the east working on the problem, but unfortunately they won't arrive till it's all over. Some say the world will cease to exist at the moment of transition.

Anyway, we are continuing to work on this blasted Y zero K problem and I will send you a parchment if anything further develops. I must end this message short because I have suffered from a terrible case of enscriber's syndrome ever since you sent us the new high-speed rewriteable tablets.

Best Regards,
Plutonius

300. Opto Scout owners manual needed

Looking for my manual the past week and unable to locate. Wondering if
anyone out there has one who could copy/scan for me. I can reciprocate
with copy of Xplorer. What has me scratching my head is that I had the
Scout manual in hand last month.....and can't fathom what I did with it.
Thanks in advance.

Seems that these have been discontinued for awhile. I bought three this past Friday, but had to go to six stores before I found them. Got the display model at the fifth store, and the display and boxed one at the sixth.

These have a rechargeable nicad pack. Anyone know where to get spare packs or how to charge these on an outboard charger or to get them to operate on external power?

I believe their manufactured by Motorola, if that helps. The AC
charger/power pack is 12VDC @ 120MA, center pin positive.

Does anybody know of a good site for frequencies (up-to-date) for the Toronto and Greater Toronto Area? I am interested in the ambulance and fir frequencies. I have done frequency sweeps on my scanner but the closest I got are faint static signals for the fire department around the 866 MHz range and almost nothing for ambulance. I figure with such a big city these frequencies would be used frequenty so that they can be picked up by my sweeps.

Thanks for all the help!

>there seems to be some very serious flaws in the ECPA laws.

Yes, there are. The biggest one is this stupid notion that dispenses with the old maxim of radio: Don't say anything on the air that you wouldn't want the whole world to hear.

The ECPA is constitutional as far as I can discern (IANAL), though it is not good technological policy. Unfortunately, the misguided nature of the policy isn't enough of a basis for dispensing with poorly drafted legislation. Now that it's law, no politician is going to stick out his or her neck to undo an obscure but important wrong. It needs grass roots support and there aren't that many scanner listeners and manufacturers with the backing to make a difference.

The ECPA is not likely to get overturned unless Congress gets an involuntary education on why this is such terrible policy. So you have two choices: Obey the law, or go underground. In either case, unless you do something anti-social, nobody will know the difference.

What no legislator or special interest group realizes is this one very important fact: now that the general public believes their phone calls are "private" they have just made telephone signal reception so much more fun!

This is the phenomenon of the law and unintended consequences. As H.L. Menken pointed out: "The American public knows what it wants, and deserves to get it good and hard."

can you trace gsm signals at all not listen in on them coz that would be hard but just trace the to a single point if any of you guys hav used some thing like hack trace or neo trace or a gps system some thing like that but programmed to trace gsm signals instead of pings dose a mobile give off a ping or some kinda packet at all so you can trace it or dose a normal phone give it off anyways if you can get back to me on that thanks

309. BC780XLT problem - help!

Newsgroup: rec.radio.scanner
Date: 2003-01-06 18:47:09 UTC
From: Ken Bessler <kg0wx@yahoo.com>
Message-ID: <NakS9.113925$Y86.95996@news2.central.cox.net>
Source record: 38893

On my '780 I have 3 trunking systems programmed - one motorola 900 and two motorola type II 800's. I also have the rest of the scanner programmed to about 75% with conventional freqs.

Sometimes the scanner will not resume after stopping on a active talkgroup. This ONLY happens on one of the Motorola Type II systems, not the other two trunked systems.

When the scanner does this, it stays on one talkgroup and passes other talkgroups on that ID so I end up hearing all the traffic on the system. Pressing "scan" fixes the problem for a few minutes.

When this happens I also hear a weak no audio carrier on the channel. Pressing "scan" or rotating the channel knob kills the carrier and returns the scanner to normal operations.

I did a full reset of the scanner and that didn't help.

I would normally suspect a firmware/hardware problem but then why would this happen on only one trunked system and not the others?

I use the scanner at two locations - work and home. The problem happens at both locations (with the same antenna - the OEM whip antenna). Unhooking the antenna kills the carrier and lets the scanner resume. If I immediately re hook the antenna the carrier is still gone - that is until the next time this happens (10 seconds to 10 minutes later).

Any ideas?

Ken KG0WX

Just program the freq you are interested in into the scanner. No need to link a freq counter to a scanner. If a freq counter says (for example) 146.850, then key that freq into the scanner.

Newbie alert!!!

I don't have a digital scanner as of yet, just an analog BC760XLT (w/o manual), and I'm curious to know how the encryption works. I'm a bit more familiar with data encryption concerning UNIX, using GnuPG and SSH/SSL. If there's any good reading, can point me that way?

For starters, how are these encrypted? Is it private/public key based, does this key change between transmissions or is a there private/public key per unit that is hardcoded within? What ciphers are used (i.e. 3DES, Blowfish, Arcfour, etc.)? Are these one-way or two-way hashes (md5 maybe)? Any insight would be great.

thanks in advance

-Zoe

I just got one of these myself and I love it. There don't appear to be any mods for it (yet) if that's your thing, so beware. Great speaker audio, lots of features that come in quite handy. Easy to use, well written manual, etc... Only trouble is, I just got mine over the weekend and ended up paying $249.00 for it. I was completely unaware that there was a sale on this thing just a couple weeks ago for about half that price... :(D'oh.

Downsides:
1) problems with the programming software & cable, as I'm told, though I havn't had any firsthand experience with this yet.
2) Software to program the unit is only available for Windows (which leaves us Mac/Unix users out in the cold) - I've mailed Don Starr to see if there's any possibility he might provide at least *part* of the source code to his programming interface. I hope he understands our pain :)
3) No mods (yet)
4) Not many accessories (a carrying case or some sort of protective cover would be *really nice*).

Otherwise, I'm quite happy with it, so far.

As for battery consumption, just use NiMH or even NiCd and get an extra holder - or just keep the non-rechargeable holder ready "just in case" (they provide both with the unit).

It's happened to me.

I once was out for a walk with my old Yaesu FT-470 dual-bander and a
cop insisted on pestering me about it:

"Can this receive police frequencies?"
"Yes" (I had done a mod to allow it to receive freq's in the 470MHz
band, but not xmit there)

"Can it transmit there?"
"No"
"Show me..."

blah... afterwards, he was pretty cool about it and commented that
there had been some "incidents" in the area that involved people using
scanners to evade the police.

Congrats on getting an ICOM IC-Q7.
My wife and I have one and they're
neat little radios. My only complaint
is that my finger gets tired pressing the
PTT button.

Check out the tk7 software I wrote for the IC-Q7.
It makes programming my IC-Q7s much easier
and works on Linux, MacOS X, Windows (95 and
later), BSD, UNIX, etc.

You can view screen images and download it
freely from my web site at http://parnass.com

I don't warrant the software, but it won't
cost you anything.

PS - I wrote tk2 software for the IC-R2 receiver
version, as well.

It may or may not help, but trunktracking scanners can be told to look for or ignore the disconnect tone the repeater puts out to get all the radios on a particular talkgroup back to the control channel again. I remember having the opposite problem on my old 895 years ago - the scanner would resume scanning before the comm was finished. Turning off tone detection fixed that problem...

There should be a menu setting on your 780 in the trunking menu that turns this feature off or on. Try playing with it. I'd tell you more but the scanner is at home and I'm not... Menu then 3 then.... you'll have to hunt from there.

From what you describe the system may have a sticky repeater and if so then it's a problem on their end and they will fix it ASAP if that's the case - them repeaters ain't cheap!

Did this start recently or has it always been like this? Anyone else in your area noticing the same thing? I bet a trip to a local scanner dealer and a test run on their radios would do the same thing... I think it's their system, but try the tone disconnect option first.

Hello,
I've had no problems with the Pro-95, Have had no problems with the cable or software, Well I kind a take that back RS sold me a cable and software that did not work but that was no big deal, got the cable from http://www.pro95.com/ . Took only 3 days to arrive and got the software from http://www.starrsoft.com/freeware/Win95/ I know you know that but put the address in case others read this and wanted the address. I my self think that the battery life is way better then I thought it would be. Hope this helps you in some small way to make up your mind.

> Can Diamond discone be easily disassembled too?
>

It can be disassembled, but wasn't designed for that on a frequent basis. It was designed to be installed as a base station antenna, preferably on a pole, high enough to clear adjacent structures. If you want something better than the "built-in" scanner antenna, but still want portability, you might consider something with a mag mount, and enough coax to allow you to place it outside, at roof level at least, and preferably on something metallic.

This just started recently (1 week). As far as other users, I don't know
any.

As far as tone disconnect goes, I can't find any option on the '780 that
does
that.....I guess I'll wait and see if the TRS managers get the problem
fixed.

You know you must have a lisence to use these right?
I bought the 1 watt version and the lisence is mentioned about 10 times in
the manual. Mine has 2 channels A & B

You don't have to. Go to any RadioShack. If they don't have them, they will
search the stores in their district for it and have it shipped to that
store, you just pick it up there.

351. pro-2053 hidden frequencies

Newsgroup: rec.radio.scanner
Date: 2003-01-07 14:26:38 UTC

I have a "brand new /in the box" AOR 8200 Mk3 that I just recently
bought and since have had decided to go with an AOR desk model...
I took it out of the box only for about 30 minutes just to see if indeed
it would go from 100 kHz to 3000 MHz with no gaps, and indeed, it does.
I did not input anything into it except for a VFO scan...
I will ship anywhere in lower 48 for $575.00.
Email me if interested at: mlynn54@yahoo.com
Thanks
-Mike

> ummmmm, WHY have multiple scanners of the
> SAME model? Wanna fill me in, a rookie ...

The other poster explained how he uses several
of the same model scanner in one location by
dedicating them to different purposes and
programming each one differently.

There's another motivation for having multiple scanners
of the same model.

If the scanner model supports cloning, you can clone
the scanners amongst each other so they are
configured with the same frequencies and install
them in different places.

I have a PRO-2067 mobile, three other PRO-2067s
in different rooms of the house, and a PRO-92 portable.
They all contain the same frequencies in the
same memory channels and search ranges, which makes
it easier to switch from using one scanner to the
other.

I have other scanners, too. The PRO-2067s and
PRO-92 were obtained at low lost cost by purchasing
some of them used and others when they went on sale.

Thanks Phil! That seems to have fixed the problem. What I don't understand is why the default mode for this feature is "off". Maybe it slows down the scan resume time but I haven't noticed much of a delay.

As it stands now, either the problem is solved or I'm going through an unusually long period (20 min now) of normal operation....

What I still don't understand is why this system and not the Boeing system has this problem. They are both Motorola 800 Type II systems.

Thanks for the help!

You have the BTX-128 which is a totally different radio than the BTX-127 MURS radio. You need a license to talk on your 2 channel UHF radio.

You do not need a license to use MURS radios.

Jon

From: Lou <tech@dp.net>
Message-ID: <avfadl$18ch$1@news.dp.net>
Source record: 38846

Hi Folks.. I'm going to post this "once" here to see if any interest..

I have for sale, several Crystals. These are the typical scanner size crystals. ALL known facts will be listed. The quantity will be shown as well. ALL are being sold AS IS. No returns. I'm only assuming that some are for Bearcats. The others I'm not sure of... Possibly Bearcat, Regency, Etc?

12 - various crystals mostly of UHF, but some others in there. Bomar, Sentry and other makes. Unknown what radios they work in. USED and UN TESTED... 25 cents each.....

10 - 460.500 MHz marked BCT type - by American Electronics. (NOS) IN PACKAGE - $3 each.

2 - 460.500 MHz same as above as to type and distributor(?). - LOOSE - maybe used - UN TESTED. 25 cents each.

1 - 460.400 MHz marked type MRU-2 - by M-Tron Electronics. (NOS) IN PACKAGE - $3 each.
4 - 33.760 MHz marked type MRL-2 - M-Tron Electronics. (NOS) IN PACKAGE - $3 each.

Shipping is extra - UNLESS - you buy ALL of them... then "I" will pay the shipping. If you play with or collect older crystal scanners of different makes and models and some of the agencies in your area use these frequencies, this may be a good deal for you. Not many people in my area deal with "Crystal" stuff even to collect it. Some of the frequencies aren't even of interest locally. So no sense me keeping these on stock.

IF you are interested in any or ALL, please e-mail me direct to make sure I get the message.. Sometimes I don't get to read the newsgroups. ALL pertinent information is below to reply to if ordering.

Bought this radio a week ago for $149 at rat shack.

Audio seems a little "scratchy" but that might be because I am 10 miles (approx.) from town, where most of the action is. I even bought the radio shack replacement duck antenna ($17) which is somewhat longer, but the reception is still not what I would expect. Any ideas?
I do not want to install an enternal antenna, as I live on a Army base. Considering getting a GRE II handheld model amp. Will this make much difference?

thanks

The replies you have been getting so far have not been very helpful, so I will take this on. The GSM frequency ranges are available on the web if you do a search. I have not been able to find specific channels listed, but then again I have not looked very hard either. If you scan these ranges you are not necessarily going to get anywhere, due to possible interleaving of other radio services with GSM. If you are convinced that the channel you hear is a GSM one (I don't even know whether there is encryption beyond freq hopping on GSM) then you could take out a handheld radio direction finder and home in on the transmitter, whether it is a tower or a phone. Unfortunately, where I live, this is a meaningless exercise since there are so many idiots out there with cell phones anyway, on buses and trains for starters. I don't need an RDF to find them, which is most unfortunate for me. If you are into looking harder than usual for a cell phone or other radio transmitter, then I recommend the Debco DF-100 (I forget whether that is the exact model number) handheld Carrier Phase RDF. I built one of these from a kit and it works well. You have to be into advanced kit building such as coax cable soldering, etc. to build it; and some important details are left out of the instructions. Any ham (for example) worth his ticket should be able to help you assemble it, and a ham will probably not object to your taking on such a project (an RDF usually has little nuisance value, and most of the time has the opposite effect). There are other handheld RDFs available in kit and ready-to-run form; search the web under "RDF," etc. The Debco device will home in on just about any radio transmitter, including ham and CBs, and is a good "keyclown buster."

TTYL,

Ian Douglas

373. Re: Grove Scanner Beam versus Antenna Warehouse Prices

Newsgroup: rec.radio.scanner
Date: 2003-01-07 22:41:08 UTC
From: great_newtamus@hotmail.com
Message-ID: <fcaaa5e7.0301071441.2345011f@posting.google.com>
Source record: 38756

Your math skills may be OK but you would seem to be using incorrect figures to arrive at you cost analysis conclusion.

As advertised by Antenna Warehouse in Grove's own Monitoring Times Magazine Dec. 2002 issue their Log Periodic is $69.50 Priority S&H included.

On their website, or eBaY listing the cost is listed as $56.00 + S&H. S&H cost quoted by them via phone on 01/06/03 to zip code 93555 in CA. was $10.65. Total $66.65.

This works out to a difference of as much as $7.35 for one shipped to CA. I assume shipping locations closer to them would make this total cost difference even greater in favor of Antenna Warehouse.

Also you lose your bet. The antenna are exactly the same, made by the same manufacture. When Grove refers to their "improved" antenna they are referring to a former model that they sold. These "improvements" have always been incorporated into the Antenna Warehouse Log Periodic.

I have been seeing Antenna Warehouse advertising in Pop. Comm., Monitoring times, CQ, Nut & Volts, eBaY, and their own website for about 5 yrs now. Why do you refer to them as just a "Ebay" competitor? What would be inherently wrong with them being just a "Ebay" competitor anyway? Where else on the web can you see a written record (feedback) of how a business conducts themselves before you do business with them? Seems to me that this is a distinct advantage, again in favor of Antenna Warehouse.

One can "vote hands down" with whomever they choose to, and do business with whomever they wish, but when the correct facts are taken into consideration it seems to me that Antenna Warehouse IS distinctly the better deal in this case.

We're talking about the BTX-127, right? It's only a single-channel
radio. I don't know what radio you're talking about.

Both Radio Shacks I went to reminded me that I needed licenses.
They're wrong.

You do not "need" a license to use these radios.

No radio requires a license to use.

Some radios require a license to legally transmit, however this ain't
one of them. It may require a license to legally transmit on some
frequencies, but some of them do not require a license to legally
transmit (MURS).

378. Questions On "Tones" ?

Newsgroup: rec.radio.scanner
Date: 2003-01-07 23:39:51 UTC
From: Robert11 <rgsrose@tiac.net>
Message-ID: <avfodk$1q0$1@slb3.atl.mindspring.net>
Source record: 38761

Hello:

Really new at this.

Haven't gotten my scanner yet, but trying to learn a bit beforehand.

Regarding "tones" :

a. Do all the non-trunked, analog, frequencies I will likely be entering
(P.D.'s, aero., etc.) have a tone freq.
associated with it, as well as the main freq. ? Or, just some?

Many of the freq's I've cataloged for future use from the many listings I've
found do not "seem" to mention a tone freq?

Some do, though.

b. If not on a trunked system, why the need for the tone?

Wouldn't there be only a single assigned user, ever, on it ?

Thanks,
Bob

Did you mean 200MHz feqs? Because the 2053 already covers some of the
400's. If you did mean 200, then go to Don Starr's site
(starrsoft.com, I think) his Win93 program will allow you to program
freqs that are out of the normal range for the 2053.

p.s. I love mine! If you can find them, they are now on sale for
$116.00

Yes, you can. It comes in a nice plastic holder you could keep, in that case. There are other antennas that may fit your need, but I highly recommend this Diamond D130J for broadband reception along with the ability to transmit in the VHF and UHF ham bands.

Ed

> (P.D.'s, aero., etc.) have a tone freq.
> associated with it, as well as the main freq. ?

No. The AM (aero) frequencies never have a "tone" (a/k/a "CTCSS" or "PL") in use.

> Or, just some?

Just some .. especially useful in crowded metro areas where many agencies share a frequency. You can "filter" out agencies you don't want to be bothered listening to, simply by specifying a tone for the agency you DO want to receive. Also helpful in ID'ing a "mystery" user by having the radio do a "tone search" while monitoring a frequency. The tone displayed may help in identifying which agency is using it.

383. Computer Keyboard/Mouse Interfering with Scanner

Newsgroup: rec.radio.scanner
Date: 2003-01-08 02:14:31 UTC
From: Chad Clark <chadrclark@REMOVETHISlightbound.com>
Message-ID: <4RLS9.79$iG1.85956@news.uswest.net>
Source record: 38766

Hello,

I recently bought a Radio Shack Pro 95, and have it in the same room as my computer. Everything is working great except I get a little reception interference when I am on the computer and I scroll through a webpage or word document with my mouse or keyboard. When I am on the desktop or any place that there isn't a scrollbar, I don't get any interference when I move the mouse, use the scroll wheel, or type on the keyboard. It's not really bad, just a little annoyance on a few of the channels I listen to. I don't get any other interference when the computer is on. I've tried to plug the scanner into a different outlet, but moving my scanner far away from my computer isn't an option. That is where I mainly listen to it. I've searched previous threads and have seen people recommend RF chokers (called ferrite rings also I think), but I haven't seen replies if they worked in situations similar to mine. Should I put these on my keyboard and mouse? If so, where at? Am I looking at the wrong cause of the interference? If the ferrite rings work, where can I purchase them? If anyone has any information on the subject, I would greatly appreciate it.

Thanks,

Chad

The receiver is picking up signals generated by the computer. Ferrites will have no effect on this type of interference. Short of putting your computer in a faraday cage or using an outside antenna you will have to live with it. Such is life in the FCC Part 15 world.

393. BC780XLT Interference

Newsgroup: rec.radio.scanner

Hello,
I recently installed a brand new BC780XLT into my vehicle to use as a service aid. (Motorola Shop). I noticed that as I travel, I constantly hear digital paging in the background behind ANY VHF conversation. This is not strong enough to break squelch on its own, but only when the audio has opened for a regular conversation. This is real annoying. Has anyone else experienced this? I seem to suspect that the IF in the radio is picking up a digital paging 72 Mhz link or something. It happens anywhere I go within a 30 mile radius. Any thoughts?

You may want to try setting your VHF freqs to NFM.

It's a bit of an oversight on Uniden's part - the frequencies don't default to NFM in that range, but they should.

That will most likely fix it. I use NFM on all my VHF freq's and nary a pager gets thru.

"New Improved LAPD????" Gonna take them a good long while to just overcome the disasters brought on by the hiring blitz of the 1990s. Chiefs "Willie from Philly" and "Pay-em-all-back" Parks set that place back to depths it hadn't been to since the 1940s. The traditional fine-toothed comb background investigations went right out the window as they scrambled to replace over 3000 retiring coppers - over a third of the department - who had come on in the Vietnam era. So they ended up with trash like Perez and his cronies... but that's another thread....

I'm in pretty regular (like several times a day) contact with all the guys who've done feeds from LA City & County, and so far none has received their 250Ds yet. Tracy "freqofnature.com" expects his any day now, but may be using it for himself rather than hooking it up for a feed. Don't know about the others. I've heard from only ONE person in So Calif who's received a 250D... and he's in San Diego.

There have also been some fairly significant discrepancies about LAPD's frequency lineup, which will be the first order of business for a couple of the guys to straighten out. My old "buds" at Communications Div seem to have gotten strangely silent with me of late... wouldn't surprise me if, well, never mind that. LOL

Shouldn't be long now.

Source record: 38784

I don't know that you can rule out ferrite beads yet. The noise "may" be coming from the cpu itself, but it could also be coming from:

(a) the monitor
(b) mouse
(c) keyboard
(d) cable modem (if you have one)
(e) router (if you have one)
(f) printer

or anything there in your computer room, near your scanner that is pulling current. Or it could be coming in through an AC plug if you have your scanner plugged in to a wall outlet.

Anyway, if you really want to get rid of it, your gonna have to experiment, one cord at a time, and see what the culprit is (and remember, there is the cable that connects a peripheral to the computer, and a cord that plugs the peripheral in providing power. If you go one cord at a time, you'll find if in fact there is any thing there that is causing your problem. Powering down the CPU itself tells you nothing as it also powers down other stuff.

If you can identify the problem, then ferrite beads may help. You can order many different sizes and types online, like here:

http://www.palomar-engineers.com/Ferrite_Beads/ferrite_beads.html

and you can read about them here:

http://www.antennex.com/shack/Dec99/beads.htm

As you can see, they aren't exactly cheap, so you want to make sure you're choking cords that are actually causing interference, and not haphazardly attaching them to everything.

hth,
jeff

402. how to view/search downloaded ULS database?

Newsgroup: rec.radio.scanner
Date: 2003-01-08 14:06:19 UTC
From: digitalsandwich@netzero.net
Message-ID: <212f9087.0301080606.3eead3f6@posting.google.com>
Source record: 38785

I downloaded the ULS database from

http://wireless.fcc.gov/cgi-bin/wtb-datadump.pl

Now, how do I go about viewing and searching through these files? I believe Excel is out of question since the database has too many lines.

Do I use Access? If yes, how do I go about setting up Access to view and search the database? What about 3rd party software?

TIA

Message-ID: <3E1C4008.4F39@rglobal.net>
Source record: 38786

I have a "brand new /in the box" AOR 8200 Mk3 that I just recently
bought.
I took it out of the box only for about 30 minutes just to see if indeed
it would go from 100 kHz to 3000 MHz with no gaps, and indeed, it does.
I did not input anything into it except for a VFO scan...
I will ship anywhere in lower 48 for $525.00.
Email me if interested at: mlynn54@yahoo.com
Thanks
-Mike

404. Re: Identify data-signal

Newsgroup: rec.radio.scanner

Well for the moment i use MDT, Motorola Data Terminal, which is quite good and covers the Firedepartment. However it won't read this signal, so i have to start from scratch again :). BTW, the reason it's so loud is probably because the signal is taken out of the discriminator output....

Cheers

: Had a r-2 and was really not too impressed with it and hated the SLOW
: scanning and no keyboard freq. input.

Consider the Yaesu VR-500. It has a full keyboard (direct freq entry), 1000 memories, DC to Daylight (less cell), BNC antenna connector, runs on two AA cells, about the size of a VX-5r but thinner, receives AM, FM, WFM, SSB & CW, tunes in a small as 50 Hertz incriments.

There was a coupon sale pre-Christmas, but I'm nost sure if Yaesu has lowered the price officially now or not ... AES (www.aesham.com) is selling it now for $190.00 including the ni-cad pack and charger.

Another use for "tones" on receive is that some listening locations have a problem with interference ("intermod") and putting a tone requirement on a channel will stop the receiver from opening up for those non-desired signals.

Note: 90 to 95% of us don't have scanners with tone capability. So don't think you're missing out if you don't have one.

I hope you're not charging these batteries in the radio. I don't believe
the radio is designed to charge ni-Mh, only ni-Cads.

---> Here is my reply to what Mike Copeland wrote 1/8/2003 12:53:16 PM

The manual states you can charge nI-MH or Ni-CD batteries. You need to
charge about 1 hour for every 1,000 mA in other words a 1200 mA battery
would take about 12 hours to charge. For best performance I suggest 1600 or 1800 batteries.

This is the model I have....Do I need a lisence or are there some freqs.
that I can program (set the dips on) to use WITHOUT a license. I have NO
INTENTIONS on getting a lisence, and if I must to use it, I will return it.

Thanks for clarifying this for me! I do not know/understand the bands and
fcc regulations !

You can. But I took the easy route with mine and got the external
charger for the NiMH/NiCd batteries (charger does either one with the
flip of a switch) and just keep a spare set with me and charge them
externally.

Ayup. 1200 mAhr batteries give 12 hrs, 1800 mAhr batteries give 18
hrs. 6 hrs additional. And, take 6 hrs longer to charge in the radio.

Not clear to me why:
removing the battery holder,
removing the batteries from the holder,
putting new batteries in the holder,
putting the holder back in the radio,
putting the old batteries charger,
is the EASY ROUTE?

To me, the easy route is to plug the AC adapter into the radio when I go to bed, unplug it when I get up. I can get 1 hour of use for each hr of charging. I can easily charge for 8 or 9 hrs overnight, and I find it difficult to use the radio continuously on batteries more than 8 hrs a day.

But, to each their own. My way works fine for me.

Here you go, Mike -

The FCC ID number starts withan "I" rather than a "1"

It's a Spectralink Corporation spread-spectrum telephone, (which means it does "frequency hopping" as you talk), using frequencies in the "ISM Band A" between 902 & 928 MHz, output in 105mw (1/10 of a watt)

Their original 12.19/1995 FCC application can be found via
http://shorterlink.com/?39XN2M
And the resulting FCC Grant is at http://shorterlink.com/?XD720X

Unfortunately, any documentation that may have accompanied it (there were probably pictures, schematics, maybe a manual, etc) have been removed from the FCC website

Most common spread spectrum/hopping eavesdropping equipment will hop at speeds between 100 and 50,000 hops per second. Equipment is readily available that hops even faster (100,000 to 300,000 hops per second).

From the FCC website, Part 15.247: "(i) Frequency hopping systems operating in the 902-928 MHz band shall use at least 50 hopping frequencies. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz. The average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period.

You might find info at their website, www.spectralink.com - but being 7 years old or so, there may not be much available.

Dear All,

I just received from AES two antennas for my Yaesu VR-500.
I ordered a Diamond RH77-CA and a Smiley SuperStick II extendable to 54 inches.
But when using the superstick, do I have to extend it to the maximum, and then start scanning the band, or do I have to play everytime I heard a signal, checking for the correct antenna extension?

Also, if I want to hear the amateur radio band, what band should I turn to approximately?
Thank you,

Bruno

421. Two Scanners And One Aerial Question

Hi,

Will be using one of two scanners at a time.
Have only one aerial, a Discone in the attic.

I guess an antenna switch makes the most sense, but was wondering about
other approaches also. So, let me ask:

a. Does the switch make the most practical sense?
Again, only one radio in use at a time.

b. What about couplers? (freq range of 30 MHz to about 2 GHz)

c. what about "just" feeding the signal all the time to both inputs? One
set would be Off, as i mentioned

I guess I should also ask how any of the above might change if the second
set "accidentally or otherwise," is also on.

What are the differences in the sets aerial input impedance for a set being
on or off?

Much thanks,
Bob

More likely it's VHF HI band paging overloading the radio. You can search around 152 and 158 with no antenna on the radio to see if particularly strong paging stations are nearby. Once you identify the source of the problem there are several steps to take. Use PL/DPL when you can, use NFM mode, and use the attenuator as needed. Ultimately you can buy a notch filter for the offending paging frequency if nothing else works. Grove Enterprises has them.

I prefer Maxwell's approach. I used to use a converter when I was
living in a small apartment, but being in a house, I may not want to
unplug and move the converter if the scanner goes dead while listening
downstairs, etc... Also, 12-18 hours is longer than I can usually
leave the scanner plugged in, so I would never get a full charge.
With two sets of batteries and one charger, I can put 4 to charge and
forget about them for several days.

Just my approach, however,

-daw

Bottom line, you can just use a "T" connector and run both scanners on the one antenna. There will be some loss this way, may a notable amount on the higher frequencies, but unless you are already listening to weak signals, you shouldn't have an issue with the loss.

Others will probably offer you all kinds of advice on splitters, switches, etc, but in most cases with receiving systems, its not worth the bother, unless you are concerned about every last dB of signal strength.

Ed

Relax, Mike. He's wrong. Check your manual. NiMH are fine. God, does
anybody making anything electronic still design for NiCads only (in the
rechargeable realm)? NiCads are obsolete.

429. Re: how to use a whip antenna?

Newsgroup: rec.radio.scanner
Date: 2003-01-09 00:17:55 UTC
From: UsenetUser <marnells@cox.net>
Message-ID: <Tc3T9.6110$hG5.983887@news1.west.cox.net>
Source record: 38712

You want to aim for the common "quarter wavelength" for best reception with a simple whip antenna. Basic rule: the lower the frequency the longer the antenna. E.G.: cellphones at 800 MHz use little 3.5" antennas. CHP uses 42 MHz, their qtr-wave antennas are big ol 66" antennas. Qtr wave CB antennas (27 MHz) are best at 104"

Now, there's a basic formula for determining quarter wavelength, which is:

2808 divided by frequency (Mhz) = antenna length in inches.

With your Superstick, if you want to monitor trains, say, at 161 MHz, use
2808/161 = 17.4" antenna

2-meter ham frequencies are from 144-148 MHz. For 146 MHz, antenna should be
2808/146 = 19.23"

If your police are on a 460 MHz freq, like 460.35, it's
2808/460.35 = 6.09"

Just round those numbers off to the nearest inch or two, it's not all that critical. Just remember... higher frequency, shorter antenna. Lower frequency, longer antenna.

A rough guide, then:

vhf low band (30-50 MHz) - about 60 - 75" or as close as you can... 54" should be just fine.
vhf high band police/fire (140-174 MHz) - 17" -19"
UHF police/fire/business (450-500 MHz) - 5" - 6"

The most popular ham (amateur) bands are "2 meters," from 144-148 MHz .... 19" antenna
and "440" or "70 cm" band - 440-450 MHz (some stuff between 430-440, but not much) - 6" antenna

I spoke to a gentleman at Scanner Master on Monday 1/6 when I ordered some books. I asked about the remote head and he said that they are currently working on getting the unit into mass production. All they have had for a while now is a proto type. I saw the unit working at the Boxboro, MA Ham Fest in August of last year. He couldn't give me a time frame on availability.

Does any of the following TV Stations have "Live Coverage" of incidents just like how "KTLA" in L.A. will do?

The stations I receive here on Satellite dish out of the Eastern Feeds are as follows:

WSBK - Boston
WPIX - New York
WTBS - Atlanta (This one I doubt does)
WHDH - Boston
WCVB - Boston
WBZ - Boston
WFXT - Boston
WGN - Chicago

I too would love to be able to see a chase on TV and listen to a scanner feed online. Why? Because I Can.

I know as far as I know, KTLA out of L.A. is my only hope at seeing something like this.

I bought one and I like it, but I would NOT buy another. The radio would
probably be better if the manual was better written and the radio didn't
think it was a computer.

If one reads the manual, on page 11 it states that both NiMH and Ni-Cd may be used and charged in the radio. The one thing noted is that Ni-Cd's should not be recharged until the low battery indication comes on.

I am using the NiMH 1600 cells and at low volume I get 18 - 20 hours of use on a full charge. I come out of the ear phone jack to an external amp at home and a modulator that feeds through the car FM radio on the road.

A "T" is a simple RF connector adapter to allow two RF plugs to go to one jack. If you are using UHF type connectors, you'd want to buy a UHF T, such as Radio Shack 278-198 for $4.00 US. (You can see it here:
http://www.radioshack.com/category.asp?catalog%5Fname=CTLG&category%5Fname=CTLG%5F005%5F003%5F001%5F010&Page=1

DON'T FORGET to put both lines above on the address window!

If you are using BNC connectors, you can get a Radio Shack 278-112 for $4.39 US.

Ed

Source record: 38725
Cross-posted to: rec.radio.noncomm,rec.radio.scanner,rec.radio.swap

For Sale: One New Uniden BC200XLT handheld scanner with cell modification.

This unit was purchased in 1994. It has never been removed from the box.
It is still in its original packaging. It had been modified for full 800MHz
coverage before it was sold to me. All accessories included: antenna,
case, charger, battery, instructions, and earphone. I paid $185.00 for it.
I would like $160.00, but make me an offer if interested.
Please reply by email directly to me.

Thanks,
Gary

I bought one a while back and it does perform very well up 450 MHz or so.
Above that I see a decline in sensitivity compared to other rcvrs. I still
love the thing however. The dual vfo is a nice feature but I wish the
spread was greater. I don't get to use mine much on the hf bands due to
living in an apartment were everyone has computers. Way to much rfi. When
I do try however, it does a great job on stronger signals. I'm not really
talking about SW broadcast but rather ssb transmissions. It does well here!
It does well in the ham bands also. In fact Yaesu (Vertex) will claim the
specs on the radio are for the ham bands only!
I personally think it is worth the money it is being sold for now.

Hey, I would NOT advertise your auction here on the USENET. It is AGAINST
ebay policy and some idiot will turn you in!

I know, somone did it to me! hope this helps!

The 250 comes with a 1500 mAh Ni-MH pack, same configuration as the 235/245 packs but better cells.

I use two sets of Powerex 1700 mAh NiMH cells. I charge them on a C.Crane smart charger which
does a great job. That way the cells in one pack is always charged and ready to go.

You won't be satisfied with the results. The radios will send spurious signals to each other thru the connector, because there is nothing in place to isolate them on seperate circuits. I tried doing this with an Icom PCR-1000 and BC780XLT, reception sucked because of signal procuded by both radios going thru the antenna feed.

You could try a standard splitter (ie like the cable type you can get at RS), but that would require getting some additional cable, connectors and adaptors.

Just my experience....

You're wrong. There are *no* restrictions whatsoever to advertising Ebay
auctions on Usenet.

If you still think you're right, please provide proof of your claim that
this is against Ebay policy, as I could find none whatsoever.

Never used. We don't have trunking so i don't need it. It scans trunking
and conventional at the same time.
Contiunous coverage .5 - 1300 mhz. Has audio recording.
Cost $150 sell for $110.

Hello,

Just wondering if anyone knows the frequencies used by the event staff for the 2003 March For Life (aka Right to Life March) in Washington, DC; January 22, 2002.

Haven't been able to find a licensed itinerant or locally licensed frequency anywhere - I know that the staff use two-way radios to communicate, but that's about it. :-)

Michael

Doi!
It is against ebay policy to sell an unblocked scanner.

We didn't say it was against usenet policy to advertise an ebay auction.

Before doing that you might want to take a look at an article/review I had written sometime ago. If you use a BNC-T connector to drive two scanners from one antenna you're going to run into some problems (not to mention signal loss). Take a look at:
http://www.milaircomms.com/review_stridsberg_mca204.html

You'll see the pros and cons of a few different methods of doing what you want to do.

Sir, this is what it says in EBAYS web site. Once again, I was speaking
from PERSONAL EXPERINCES with Ebay....

Hope this helps...

Also, I look forward to your public APOLOGY on this board. Just beacuse YOU
cannot find something, does not make EVERYONE ELSE
wrong.

First, lets see what their policy is on cellular capable scanners being sold
on ebay, this is from http://pages.ebay.com/help/community/png-scanners.html

Scanners - Generally, scanning receivers and radios may be listed on eBay.
However, you may not list any scanning receiver or radio that receives
cellular transmissions or has "full 800mz" coverage.

What did his post say? "Subject: FA RS Pro 39 with full 800mhz
coverage"

See headers below...

Now, on to the usenet policy.....

This is found at http://pages.ebay.com/help/usenet_policy.html

UseNet Policy
eBay users may not post on Usenet groups (Internet newsgroups) to advertise eBay or an eBay listing that is inappropriate or violates the Usenet board policy. If Usenet abuse is reported to eBay, we may among other remedies) remove the listing, issue a warning, temporarily suspend or indefinitely suspend the offender's eBay account.

We have no tolerance for UseNet abuse and will take action as appropriate. Please note that we can only take action in cases where it is clear that an eBay member has posted to the Usenet inappropriately.

Usenet abuse should also be reported to your ISP (Internet Service Provider) and the email provider of the person posting on the Usenet. Both of these organizations are in a much better position to prevent future Usenet abuse. Generally, you can send email to abuse@"ISP".com to properly report perceived violations.

460. Speech Inversion Descrambling!

Newsgroup: rec.radio.scanner
Date: 2003-01-09 14:57:19 UTC
From: ctpds49@aol.com
Message-ID: <20030109095719.06110.00000538@mb-dh.aol.com>
Source record: 38568

Voice Frequency Inversion

Speech Inversion is accomplished by mixing the speech spectrum (typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz constituting the speech inversion.

They don't last too long in Seattle either (since Seattle's freeways are
always heavy traffic). There's never been
any interruption of broadcasting in Seattle for a police chase on the five
TV stations I can get.

> >I too would love to be able to see a chase on TV and listen to a scanner
> >feed online. Why? Because I Can.
> >
> >I know as far as I know, KTLA out of L.A. is my only hope at seeing
> >something like this.

The LAPD has put in new regulations to curb police chases for minor
infractions. I was listening to the news item feed
from KTLA's web site. The news reporter guy says at the end of the news item
"without all those police chases to fill up the newscast, what are we going
to do?". More trips to the Los Angeles zoo to do a feature on the elephants
there?

The chases look "Hollywood" on TV, but one wonders if one or two
pepretrators decide to do it, just to get on TV before
he gets in front of the camera at the police station?

Having been to Los Angeles, I got one impression about the people within Los
Angeles County..

..they all seem to be auditioning for a Hollywood movie 8-)

Speaking of which, and the LAPD..

"Al Bundy" (aka Ed O'Neill) as Sgt. Joe Friday on the new Dragnet? Eeek.
One look at Ed O'Neill who is a very good actor, and you think only of
America's beloved loser husband, Al Bundy rahter than everyone's favorite
cop Sgt. Joe Friday.

I'll watch the premiere, but I'm a purist when it comes to original Jack
Webb productions. They were legendary.

I have to agree with you. It just won't be the same with "Al" saying
"Just the facts, ma'am." Webb did his almost like a documentary; not
sure if anyone knows how to do that anymore. Maybe they can figure
out how to "change the names to protect the innocent."

They probably are using the low power itinerant (star and dot) frequencies
like 154.6 and 154.51, etc.

A google search for "dot itinerant frequencies" should find them.

Having had scanners for years,crystal scanners and all I'am getting behind the times.I'am looking at trunking scanners but am confused.When advertised as not being able to scan conventionally and trunk at the same time I take it as this.You have to manually press the trunk button to scan a trunk,then to scan conventionally you have to hit another button.Is this correct?I have both vhf (mutual aid) etc,so I would want to scan it all.Also is the trend to go digital popular enough to have second thoughts about buying a standard analog scanner?Any thoughts?Thanks for any help!

It is a cheap unit designed to let you play a walkman or other such stuff through your FM radio. I got mine at a truck stop for $9.95. Radio Shack sells a similar unit for a bit more. From experience, make sure the unit you get either has at least 4 freqs to select from or operates at the band edges to avoid interference from your local FM rap station.

You simply plug the cable to the head phone jack and tune your FM radio to the selected output freq. Full stereo "10-27 on ..."

Hi Guys,
Such is my love of the AR3000, I have two!! and wish to sell one.

* AR3000/A
* Mint Condition
* User Manual
* Antenna
* 3-Pos Antenna Switch
* External Speaker
* PSU
* Computer Lead
* Assorted PC Software

If you are not familiar with this FINE piece of professional hardware, visit www.ar3000.info where you'll find everything you ever wanted to know including Computer-Control, Software, Mods and Lots More.

I'm open to offers including a part-ex/swap for a decent 35mm SLR. This could include older 70's classics such as the Nikon F series, Pentax M series, etc.

Email me with your offer at offers@ar3000.info

Regards, Tom.

Norm:

The ability to scan conventiional and trunked at the same time is
available on the RS PRO-93. I do it every day with mine. I believe
that the PRO-95 and the corresponding base units also have that
capability. I listen to CHP (conventional) USFS (conventional) and
numerous trunked agencies without any problem.

I have only ever owned RS scanners so I cannot state what capabilities
other brands might have.

Good luck.

>

You are welcome, however, someone below indicated you might get mutual interference from the "junk" scanners may radiate on the antenna port. This is true. If you are going to be running both scanners at the same time, you might need to get a true "splitter" rather than just a T connector. Maybe try the T to see if you can get away with it first, as splitters are considerably more expensive.

Pro-95 doesn't have any problem scanning both at the same time that I have noticed. In fact, it seems to scan multiple trunked banks at the same time as monitoring one or more non-trunked banks.

The only "problem" I have is that there is so much traffic on KCMO emergency freqs that it is difficult to get the scanner to stop on the other banks. As I don't really monitor the other cities and services except when needed or when actually there, I don't really care about this, however.

In article <3mlT9.536$2z1.272@twister.nyroc.rr.com>,
ncampbel@twcny.rr.com says...
> Having had scanners for years,crystal scanners and all I'am getting behind
> the times.I'am looking at trunking scanners but am confused.When advertised
> as not being able to scan conventionally and trunk at the same time I take
> it as this.You have to manually press the trunk button to scan a trunk,then
> to scan conventionally you have to hit another button.Is this correct?I have
> both vhf (mutual aid) etc,so I would want to scan it all.Also is the trend
> to go digital popular enough to have second thoughts about buying a
> standard analog scanner?Any thoughts?Thanks for any help!
>
> Norm C
>
>
>

No, you just hit SCAN, and off it goes. On a RS Pro93, you only touch the
TRUNK button to hold an ID. Like when I was listening to them chasing a
guy a few days ago. I heard the chase start, held down TRUNK, and it
stayed on the chase until it was over, and I hit SCAN again, and it took
off and scanned everything, a 800 trunked system, and about 150
conventional freqs.

I myself will pass on the digital until RS comes out with one and it does
9600 baud. I refuse to mess with Uniden's annoying battery packs, and I
wasn't impressed with he BC250D at all when I played with one.

Freeq:

To answer your poorly worded question..My receiver was provided by a Mr. ICOM. He makes communication receivers. The model I used in testing was his model 7000. One antenna I used was made by Mr. Prodelin. I used his 10 ft. model. The feedhorn was courtesy of Folger's coffee. I confess I did modify it by installing the antenna probe and customizing a mounting interface. The DC Block was made by Mr. Andy Hatfield of AVCOM Electronics. The 12 VDC power supply was made by Tandy Corp. who owns Radio Shack. I am sorry, I cannot remember the name of the clerk I purchased it from 13 years ago. The 20 db in line amp was made by Perfect 10. They satellite and cable tv products Freeq. Are you following along so far? The RG6 coax cable was made by Mr. Comspec. The low noise amplifier I used was made by a individual in New England whose name I no longer remember who sold custom made amateur radio products and subsequently sold his business. Unfortunately I had to purchase all of the equipment at my expense. Nobody gave me any equipment. The rest of what to do to make things work was figured out by me. I hope this answers your pathetic attempt at a question. Now that you know, so what? It's really none of your damned business anyway.

My guess would be it is used in an Automated Vehicle Location system.
There is a Danish manufacturer of AVL equipment. The software probably is
proprietary.

Thanks for the link! Great site that will be very usefull.
Do you know of one that does TV locations?
Terry

I am selling a Uniden-Bearcat 55XLT handheld scanner for my Sister-in law.
It receives VHF low/high and UHF.
It does not receive 800 Mhz.

It is in good shape and comes with a rubber duckie antenna, an AC adapter
and 5 AA nicads.

No reasonable offers refused.
Thanks for looking.

But, his post is not inappropriate, nor does it violate the Usenet board
policy.

Also, in case you didn't notice, Jeff's auction is perfectly within Ebay's guidelines, as he does NOT anywhere within his auction mention that it's full coverage. Ebay rules cover auctions that openly advertise or even overtly imply the fact that they're "full 800mz" coverage. Since Jeff's auction doesn't mention full coverage (or even imply it) anywhere, it's perfectly legal. And, considering the auction has been active since Jan. 6th, I would think Ebay would have taken it down by now. Usually they zap them within the first hour or two at the most.

He is advertising a CELL CAPABLE scanner, which VIOLATES ebay policy (prohibited items) and therefore also violates ebay USENET policy because he is advertising that it is for sale on Ebay. (ie. "innappropriate listing - illegal item!)

I thought I'd follow-up. I managed to find two display models, one came with everything to run it, one didn't. Both had batteries. The RadioShack salesman got me a free extended warranty because they were open box. Programming them is slightly cryptic, but doable. They seem very well built, the PTT button is firm and the rubber seems rather resistant to stretching, but durable. They also have a METAL belt clip.

One note, the other salesman said "You need a license for these", and my father and I said "Yes, we know". He stood there for a while and then ventured off into the back room. The other salesman asked how we knew about them, and I mentioned an internet newsgroup and how they were now MURS radios with a few business band frequencies still on them. He thought that I knew what I was doing, which I do :D

I had a VR5000 and used it for inmarsat. I upgraded the antenna connection
to an "N-Type",
used a pre-amp with a 3ft dish and had no problems with inmarsat.

Go to URL, type in the call leters, for example WLAP.
and you should see....

WLAP-AM Technical Info:
Status Licensed Class B AM Station
Area of Coverage View Daytime Coverage, View Nighttime Coverage
Hours of Operation Unlimited
Antenna Mode Directional - 2 Patterns
Daytime Transmitter Power 5000 Watts
Nighttime Transmitter Power 1000 Watts
Number of Towers 4
Transmitter Location 38ï¿½ 7' 25" N., 84ï¿½ 26' 45" W.
License Granted June 14 1984
License Expires August 01 2004
Last FCC Update June 14 1984

I hope this helps.
Terry

I made the same comment to my wife after we saw the previews for that program. How can anyone take him seriously after playing Al Bundy for years? Kind of like how Leonard Nimoy was always known as Spock after the original Star Trek series was cancelled. I guess it's hard for actors to climb out of a role they've played for so long. Probably harder for child actors, which is probably why they seem to turn to crime or drugs.

All in all, as cheesy as it was, I still like to watch the old Dragnet series.

Tom

I love a good technical discussion. I'll pose le questionne(sp?):

Let's say one had in their possession the videoscanner product available here: www.videoscanner.co.uk

And one wanted to monitor live local studio transmitter link feeds from news helo's and live trucks (remember my pursuit thread? This would add to the sport - because even when they cut away on TV for a commercial or because the bad guy is running down the street buck nekid, etc, the live feeds continue to run)

COULD: one purchase a dish and the proper LNB to convert the 12GHz signal to the 2.3 to 2.5 range of the video scanner???? If so, which one would work, and how would you do it?

I did a search on the FCC website and found our local FOX affiliate is using 12725.0000 and 12750.0000 Mhz for this purpose. That's 12Ghz, which if I'm not mistaken, is the same range as direct broadcast satellite (such as directv, etc.) So my thought was, using a properly aimed DBS dish (which you can get dirt cheap at any pawnshop these days) should be able to downconvert the feeds to a frequency viewable by the video scanner.

thoughts?

I won't be using the business channels, so if the FCC wants to nab me, they'll have to prove I'm not using the right frequencies... I went into quite some detail with the local hams that I would never want to cause any sort of interference...

http://www.provide.net/~prsg/mursrule.htm#95.655

I think these new requirements are meant for new MURS only radios. If these radios are not legal for me to use, I simply won't use, them andthey will be sold... At this moment I believe they are fully legal. I'll continue my research :D

Using a higher power on FRS frequencies with a GMRS radio does not sound legal to me.

Hmmm.

I'm not so sure about it (but that's because I don't know exactly how it works). But the helo flies all over town, in circles and such. How do they keep the dishes aligned?

I've taken a look at the hardware the pro's are using - the antenna appears externally to be somewhat omnidirectional...

But I could be wrong.

For my BC760XLT with no CTCSS Tone board in it. (Actually I think it's there, it's just not working) (Aside from my inital questions, how could I fix it?)

Would I be able to program it through the computer, or is that even possible with my radio?

Thanks for the input.

Are we sure the the NEWS helos are really using 12+GHz? There are two reasons I bring up that question.

Reason one: I thought sometime ago I had seen posts from people who have received NEWS Helo video links using the Icom R3 which only goes up to 2.45 GHz. These posts were a result of a question I had asked about 6 months ago regarding the R3 and several people resonded that they were able to receive NEWS Helo and Sherrif Helo video links.

Reason two: Would it be feasible to transmit at that high of a freq from a Helo? While the Helo is turning and changing its position how would the keep a directional antenna pointed back to the TV station? I would think at 12 GHz they would either have to us a Dish or directional ant which would be a problem to keep pointed to the receiving station.

Just some thoughts...

George

Discriminator taps give you raw audio before it hits the audio filtering in the scanner. This allows decoding of FLEX/POCSAG/MDC4800 and other forbidden fruit...

The required proper hardware and software are available separately of course, if you know where to look.

Check this out for more info on discriminatoring and what you can do with it:

Yes. If one if the two scanners is turned off, then you wouldn't have to worry about the RF noise radiating from it on the antenna input line. Just be sure one scanner is always turned off and that issue shouldn't arise.

Ed

No, except if you are using a rather lossy coax such as RG-58,
there will be a lot more attentuation of the signals through 50 feet
of it, especially at the higher frequencies.

OK folks - the 12 and 13 GHz bands are usually used for fixed point to point relays or short hop (like from a building to a live truck on the street) use. In some really RF congested areas (DC, NYC, etc.) they use 13 GHz mobile - but otherwise mobile ENG (including helicopters) is in either 2, 2.5, 6.5 and 7 GHz. The systems are almost exclusively using directional (18db or higher) gain antennas on each end. Two exceptions to the directional antenna scenario - one is some chopper packages use an omnidirectional TX antenna and the newer digital transmission systems usually use omni transmit antennas.

About the helicopter systems - tracking antenna control can be done several ways - if the chopper is using a directional antenna, it can be steered using data from GPS aboard the airship. On the receive side, some systems use signal strengh and phase to move the receive dish. Or, the chopper sends pointing data back on an audio subcarrier of the TV mirowave channel.

>
> What type of coax would be a good suggestion?

I think a best all round choice for availability, low cost, and
low loss would be a good quality RG-6 cable. It is 70 ohm cable, but
for scanner use, that is insignificant from 50 ohm cable. It may be
a little more difficult to get connectors for it.... don't know.
RG-8A would be very good, easier to find connectors for it, but
physically larger. Good luck.

Ed

530. (*) Pro 93 HELP PLEASE! (*)

Newsgroup: rec.radio.scanner

I recently purchased a Pro-93 firmware version 1.03 and have a question.

On certain freqs, the scanner stops, there is NO AUDIO, and when I open the squelch
there is NO AUDIO either. Is this scanner messed up or am I missing something?
Sound does NOT work in am or fm mode.

Here are a few freqs that it does it on. I use this radio for MILITARY monitoring!

49.835
49.840

Are these like IF/birdie freqs or do I have a receiver that has a problem?
Thanks

Mine does not do that but it does pick up interference from the computer on
those frequencies. Try it with the antenna removed from the radio. If the
problem remains, it is probably a birdie.

Baby monitors use frequencies in that range. Some of mine
transmit on 49.83 and 49.845 MHz.

Perhaps that's what your scanner is receiving.

It is stopping on the signal, but there is NO AUDIO from the scanners
speaker.
It is not a question of it being "low audio", there is no audio at all,
nothing.
Neither on am nor fm. It says there is a signal, but it is as if the
speaker has
been muted. Open squelch all the way, go back to freq, squelch is open
all the way, no audio. Do it on am and fm, same results.

FRS? That's surprising, considering the heavy usage of FRS two-ways in the vicinitity; but with the low price and popularity of FRS, I believe it.

Do you know if they use any business band / itinerants, or entirely FRS?

Thanks,
Michael

FS: NIB Pro-95. Well okay, used for an hour. I broght it home,
programmed in one data channel and monitored to make sure it works good.
Put it back in the box after that. So if you missed the sale last month
and want to get a (virtually) new Pro-95 for $100 less than you can get
it for off-sale, this one is immaculate. I'll throw in a set of NiMH
batteries and a 2002 Police Call (w/CD) as well.

$150 plus help with shipping & insurance.

No trades please.

Thanks,
Jon

^ It is stopping on the signal, but there is NO AUDIO from the scanners
^ speaker.

My PRO-93 does this occasionally too. It's as if there is a bug in the software and it sometimes fails to enable the speaker. I think it happens most often while scanning a trunked block and I cannot say for sure that it happens with normal scans. With a second scanner I can tell that there is a strong signal on the applicable frequency. Resetting (OFF/ON) the scanner corrects the problem for a while.

> It costs a lot, but I need a good nmo mount all band.
> Opinions/ alternatives from the knowledgeable????
>
>

I have had one for a little over a year now. Here are my impressions:

- It's short, but it's also butt ugly. Don't buy one for the aesthetics.
- 800MHz: works great
- UHF: works great
- VHF Hi: fair
- VHF Lo: fair to poor depending on how you tune it. You can tune the antenna for a specific segment of the VHF Lo band. Reception in that segment is fair, but outside that range it's poor.

The lackluster performance on VHF can probably be attributed to the overall short length of the antenna relative to those frequencies.

One more thing: I wasn't very happy with the way the NMO center contact on the antenna was designed. When I first screwed the antenna onto the NMO mount on my car the reception was terrible. After some experimentation I learned that the center contact on the antenna was just barely touching the center contact on the mobile mount. The contact is just a little spring-leaf piece of metal, so I used a screwdriver to pry it out a little and reception improved, but only after I wrenched the antenna onto the mount very tightly.

Would I buy one again? Probably not- I think I'd probably try the NIL-JON mobile antenna, or -funds permitting!- install several discrete antennas for each band of interest and then feed them to the scanner through a multiplexer.

I have one piece of information.....
To date, no one in the US at least is making or selling a type certified MURS rig.

Guess the only way possible to use MURS is to either listen or modify a rig in a way against the lay as you indicate.

Sounds like a "birdie" A signal generated by the scanner itself...
However, those freqs aren't listed in the manual's birdie list.

I agree with others that you may be getting ajmmed up by a baby monitor.
You can very well not hear any audio on those.

I'm interested in writing some software to display the data sent to a mobile data terminal. I tried searching for any related information on the Web but "Mobile", "Data", and "Terminal" are fairly common together so it would probably take me weeks to filter through all the hits. Does anyone know if such software is already available, or if the protocol has already been documented and is available on the Web?

Frank

maybe if you tried searching for "mobile data terminal" (note " ") instead
of mobile data terminal.

have a nice MVC-FD91 digital camera I would like to part with.I do not use this camera enough to warrant my keeping it.It has a case for thr camera,copy of manual,and battery.I never had a charger for it as I used the one from my wifes camera.The charger can be bought on Ebay for $35.00.This camer uses the floppy disc.It is more of a proffesonal type camera.
I am asking $475.00 plus a little for shipping.Email me if interested or call me at 978-281-3359.

United Airlines Flight 93 was hijacked on September 11, 2001 near Cleveland, Ohio. The aircraft crashed some time later in a field in south-western Pennsylvania. The hijackers can be heard twice mistakenly transmitting messages intended for the passengers over the Cleveland ARTCC frequency. Please note that this tape is not chronologically accurate; periods of dead air (silence) have been removed for brevity. This file is nearly 4Meg in size.

http://www.mods.dk/ no manual but some interesting stuff on the r7000,
to program just call up the freq. you want and dail up a memory number and
press the write button.
hit memory under the start/stop to scan thru them.

Jon,

I warned you about listing anything for sale on these newsgroups.
They are populated by boobs and morons with nothing better to do then
complain, regardless of what you offer for sale.

Stick with eBay, or Rich Wells Strong Signals sight.

Dan

579. Re: Pro-39 with cellular coverage - how much is it worth?

Newsgroup: rec.radio.scanner
Date: 2003-01-12 03:59:05 UTC
From: glineberry@prodigy.net
Message-ID: <b234376e.0301111959.84cc74f@posting.google.com>
Source record: 38507

cellular coverage adds almost no value as almost all cellphones are now digital so scanners are useless. I have 5 that are capable but it is a waste of time to even try. gill

580. Re: NIB Pro-95 $150

It certainly is, considering that the radio is no longer on sale.

I would not let you Uniden 9000 go. The R7000 is a great radio but not a scanner. It is a communications receiver and not really meant to scan like your Uniden does.
The scan speeds are incredibly slow compared to a regular scanner.

> But why sell it for a loss when you can return it for a refund?

Maybe he went past the 30 day period?

> And why oh why do people buy things "to make sure it works good"?

And why Oh why do morons like you stick your nose in with rhetorical questions impuning one's integrity without any basis at all to think Jon is lying?

> Play with the demo model at the store and save yourself some money.

Great advice, but not the case here....

> If it sounds too good to be true.........

You know what, it IS to good to be true for the BOOBS populating these groups.

I know Jon Van Allen personally, and have made many deals buying and selling through the years. He is beyonf reproach, and radios that are TEN years old look like they just came out of the box.

Worry about the REAL crooks ripping folks off here, and leave good guys like Jon the ability to sell his scanner if he wants.

SHeeeesh.

Your right I'd rather pay the $249 for a "NEW" one then buy a "USED" one anyday
of the week , just kills me why people even bother to spend their money but who
cares.
But never mind the grammer , can't you fit everything you wanted to say in one
post ?
doh ! Let me guess and you voted for george bush too !

$475 for a 4 year old 0.8 MP camera..... and it uses floppy disks!!!!

Is this a joke?

During last 30 days, there have been 8 sold, with a low of $86 and a high of $135 (avg. is $97). I'd venture to say you should be able to easily get $100+ for it.

Right now, there are 3 active auctions for Pro-39's.

Nope. These cameras are highly prized by certain groups of people that must
have the floppy drive. Avg. on Ebay is between $285 - $415, and I've seen
'em go higher if they're new.

Well, for examply, I bought a BCT-12 for my car. I opened the box, played with it for 5 minutes and decided it was a piece of crap, so I put it back in the box and sold it on Ebay for 30% more than I paid for it. Why on earth would I take stuff back to the store when I can make a profit on it by reselling it? And, yes, if I buy something with the intention of reselling it, I open the package and make sure it works, and it has all the accessories before I sell it, especially if it's a unit from Rat Shack, because they are notorious about putting returns back on the shelf without inspecting or testing them.

Dan and Jon,

This group is a lot more pleasant to hang around if you just killfile the idiots and the "price police". Once you throw them all in there, we can actually have a pleasant conversation without all the static.

73,
H.

Probably MilSat. MilSats are the only thing which use FM in that range,
all comms from 225 - 400 MHz are AM except for MilSats. Plus you
would't hear Marine comms near that freq.

I guess I am missing something here...

You want them to go to http://www.milaircomms.com/audio_ua93.html
and then again have to go to the link
http://www.milaircomms.com/audio/united93-x.wav

Why not just record a introduction to the WAV file stating where it came
from.

Are you trying to increase traffic to your website, or is there a problem
giving
credit where it is due?

Thanks for clearing this confusing ordeal to me.

Mavicas are great cameras due to their design/configuration. I have two. :)

(Plus a Memory Stick Sony P9 as well.)

Love them all, and they all have their advantages.

One man's junk=another man's treasure. Gotta love the free market. :)

Your punctuation is non existent. If you seek information, it is your responsibility to communicate in an acceptable manner.

Why should we wade through your gibberish in an attempt to determine your meaning? Rather than constantly stating your spelling and punctuation are bad, why not get a spell checker and pay more attention in school? You are dooming your self to a future of failure, regardless of intelligence, if you can not communicate.

>>Is this a joke?

A while back I was ready to unload my old Sony Mavica FD-73 (0.3 MP) to
buy something with more resolution. Came to realize that Joe's teenage
son takes the pictures for his listings using the SAME camera!
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=933&item=2153472980
There's a lot to be said about a camera with 10x optical zoom, 5 hr
battery, 20 photos on a floppy with no interfacing gizmos.
This kid does more with 300 kp than a lot of guys do with
multi-megapixel gear.
The old FD-73 still fetches $150-250 on the market and are hot sellers.
I decided to keep mine. With my photography skills a bunch of extra
megapixels would be wasted :-)

One of the major pluses is that, when away from home, one can easily buy
inexpensive floppies just about anywhere. These floppies are easily readable
in any computer and there is no need for USB ports, viewing software, etc. I
wouldn't sell mine.

In a GSM phone this hidden thing is the encryption key used. This key is
not constant but is constructed from information found only on the SIM-card
and in the providers subscriber database.

I would consider a resonable offer on this camera.Look at the
auctions.$575.00 for a reconditioned one.I won't let this one go for much
less than $430.00.I have two other Mavicas,and don't use this one enough to
keep it.I can say that once you try one,you would really hate to do without
one.There is my personal waranty on this baby.

mAximo wrote:
Dave Shrader (david.shrader@attbi.com) muses:
> 2) Did Jesus do/claim what he did for fame/ financial gain/ political
> fame/ etc.? Jesus was and remained poor through his life. He knew that

\Only Mary was poor, and then only technically, since religion is big
\business. In order for her to live at the Temple, she must have been from
\the Levites who had no property of their own. Joseph on the other hand was
\a building contractor, which was a medium-sized business, and he was middle
\class. Joseph's uncle, Joseph of Arimathea, was an official Roman supplier
\for various base metals, which was big business, and made him wealthy. He
\then adopted Jesus when Joseph died, so Jesus did not become poor due to
\the death of Joseph, as is commonly taught.

Make that: Mary's uncle, which would easily explain how JoA got to be
a councilor in the San Hedrin. Dr Scott has been covering this subject
lately, and mentioned that Jerome and the Vulgate claim that he had
the position of 'decurio', and alleged this made him equivalent to the
Minister for Mines. But whether his position was in the private or public
sector, he was paying the salary of Pilatus who "readily gave up the body"
of Jesus probably for that reason, rather than the Roman law cited by Dr
Scott that executed criminals were only to be handed over to the nearest
relatives. Just as w/the question of blasphemy, burial would have been
also left to the San Hedrin, in place of any Roman law. Thus, Joseph of
Arimathea's position w/in Roman society as well as the San Hedrin should
have been the official reason for Pilatus to hand over Jesus' body.

Dr Scott usually gets his history right, but in this case, applies it
wrong. While JoA was legally a near relative, Dr Scott forgets to
mention that JoA had adopted Jesus after the death of Joseph, when
pointing out that Mary did not object to the arrangement because he was
her uncle; but as a great-uncle to Jesus, he would not have been a near
enough relative to storm into Pilatus' compound and demand the body. As
the legal, adoptive father, he would have qualified as a near relative.

> Thanks for clearing this confusing ordeal to me.
>

First we do not have problems with giving credit where credit is due and that is WHY we want you to go through the website. If you access the file directly then credit is not being given. The website gives the credits.

Next, yes I'm trying to build traffic to the website, traffic is what pays for the website. That website isn't a free-bee like some hobbiest use. If you access the .wav file directly you cost in real money in the form of bandwidth which I get billed for and I get no benifits such as the logged traffic. Logged traffic is then converted into income in the form of advertising revenue.

So, your Accusation of me having a problem giving credit were credit is due is totally wrong, by having people link directly to the file as you suggested is doing exactly what you accused me of doing......

618. FS: sma-to-bnc custom fit antenna adapter

Newsgroup: rec.radio.scanner
Date: 2003-01-13 01:24:37 UTC
From: gulyas@earthlink.net
Message-ID: <12235960.0301121724.70dae44d@posting.google.com>
Source record: 38547
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner

Do you have a need for a high-quality SMA-to-BNC antenna adapter that
is custom made to fit and protect your H.T. or scanner radio?

Adapter allows you to:
Quickly change antennas to base, mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna
changes.

Adapter features:
Gold plated contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed
for moisture and dirt protection.
The base also provides an excellent support for any length of antenna
or application.
No need to remove adapter once installed to make a quick and safe
antenna change.

Sizes to fit radio models:
Yaesu: VX-5R, VX-7R, VX-1R, FT-50-R, VX-10, VX-150, VX-110,
VXA-100, VXA-120
Icom: IC-T90, IC-T8A, IC-T81A, IC-Q7A, IC-R2
Kenwood: TH-D7, TH-G71, TH-F6A, TH-F7A
Alinco: DJ-V5, DJ-X3, DJ-S40
Standard: C508A, C510A
Radio Shack: HTX-420, HTX-400, HTX-245, HTX-200
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine, and the Nov. 2000
Issue of QST Magazine.

$11.95 + $1.50 S+H(One to unlimited)
(Check or money order only in U.S.Funds)
(Specify-radio-model)

STEPHEN G.GULYAS
706 LALOR ST.
TRENTON, N.J. 08610
U.S.A.

A photo of the adapter is available upon request.

I welcome any questions or comments at my email:
gulyas@earthlink.net

Thanks for looking at my posting.

Try these, they'll get you started. A suggestion: Try a Google search
when you need freqs (or anything, for that matter). The hobby is much
more enjoyable when you dig out the info yourself. (No flame, just a
friendly tip).

Please accept my humblest apologies! I was not "accusing" you, I just did
not understand
that you were paying for bandwidth, etc. I thought you were using a free

www server, etc...
I was NOT saying that YOU did not give credit to the source of the wav files,
I was meaning to say, which I guess did not get through, was if there was a problem
stating WHERE the wav came from by linking to the file, but I get it now that you explained
to me that you are paying for bandwidth. I use a comsumer server, Road Runner, so I have
unlimited bandwidth and was unaware that some people had to pay for bandwidth usage.
I was under the impression that your page was merely a page by a hobbyist, and did not
see the "products" section of your webpage. Once again, please accept my humblest
heartfelt apology!

Also, I enjoyed the information on your webpage, and it has helped my monitoring here in
New York.

God bless!

You have got to be the most ignorant person to ever post to this news group.
Nothing wrong with asking questions, but it sure makes life easier if you'd
put them in a format that is generally accecpted by the rest of the users of
the group.

PLONK.

> --Scott
> P.S. Is the Icom R2 Reaction tunable?

The R2 cannot be tuned in real time by software
in cloning mode. It may be possible in "alignment"
mode, but I don't know and that sounds risky.

I don't know of a "universal file converter."

A lot of the file formats are kept "secret" and that's
too bad. I can help you with my software, of course, because
none of it is secret and it's free (http://parnass.com).

Though it's quite involved, you can learn about the
SPG format used for programming the PRO-92/PRO-2067
if you download Ken Plotkin's 92ware program.

ICOM IC-R2 memory image info may be obtained from
http://uk.geocities.com/blakkekatte

It would be great if all radio software could at least
import and export frequency information in an open,
well documented format, like a CSV (comma-separated
values) file.

This is the main reason I wanted my first, an FD-83. Ubiquitous media.
Plus, disks run from inexpensive to free.

Moreover, when in the field (or wherever), you can make duplicate or
multiple copies of the media in the camera, and hand them out to anyone
who wants/needs them.

Excellent for on-the-job, visiting with friends/relatives, etc.

The camera even generates an HTML document (webpage) on each floppy
so even my grandmother or non-PC-literate folks can participate.

Dude! Help us help you to help yourself. You state life is too short for punctuation. Well, life is also too short to read mispelled run-on sentences that make no sense and have all the tact and flow of a train wreck. I consider myself well versed in cellular and digital radio technology but even I find your posts totally incomprehensible.

Think about what you are asking for and how you are asking. Is it any small wonder why you're getting constantly flamed? GSM is unscannable to the general public in the US, and most of us have little to no interest in monitoring cellular these days anyway.

Slow down and actually compose a complete thought. Then those of us who choose to help can actually do so.

Today's airwaves aren't much different then they were when the Pro-62 was released. Whatever it was designed to receive then, it will receive now.

Today's technology is irrelevant to the Pro-62.

Dan

Some people don't know what they are talking about,(too much money).You
probably don't even know what it is never mind making such a comment.Theses
camera are professonal type cameras.Not the basic cheap camera.If you want
it ,buy it.If you don't want it ,don't buy it,but keep your bad remarks to
yourself.I know some of you are out there to cuase trouble,I just don't need
it thank you.Have a great day.

642. Video on a scanner

Newsgroup: rec.radio.scanner
Date: 2003-01-13 22:29:37 UTC
From: David Schofield <davesc@clara.net>
Message-ID: <1042496977.38218.0@demeter.uk.clara.net>
Source record: 38574

Hi this is a bit of a wierd question but here we go.

Does anyone have a URL or a simple circuit for a 10.7mhz IF to video demodulator. I'm trying to use my Icom 8500 IF output to decode dxtv and ATV video feeds. I know this can be done with a tv-r7100 tv reciever module from Icom but this is no longer available (and a F****R to find one second hand).

I've found a few circuits but they all seem to be of Australian or American origin which all just upconvert the IF into the VHF band one tv channel range for tuning on a band one tv (if I had a band one tv I wouldnt need to use the Icom :))

I'm looking for a simple circuit to do a straight conversion of the IF to video, I know the bandwidth is a bit on the high side but I can always change the filters at a later date.

Audio and colour don't matter just a mono video conversion is all I need at the moment so I think it should be possible with a few passive components, see page 45 of long distance tv reception for the enthusiast (Roger Bunney bambini books 1981) if any of you have access to it.

Sorry if all this is a bit longwinded but it'll make an interesting experiment if I can get any results.

All the best for now.
Dave

Don't know if this will work on your ICOM, but take a looksee at this...

http://www.leeselect.com/shopping/pricelist.asp?prid=495

I should think all one would need to do is tap the 10.7 IF modulator on any radio if it didn't have one standard and this would work.... I don't see any reason why it would only work on an AOR 5K...

I wonder.... (click click click) Gadzooks - the 5000B costs HOW MUCH?!?!?!? (gack! cough!) Sure would be a great addition to the shack though....

I'd need to factor in the cost of a divorce too, if I spent that much on "another scanner"... Durned females - they just don't understand... ;-)

What that program does is use the sound card to decode the old MDC4800 MDT protocol. It's hard to find but it IS out there - do a search on MDT Monitor and then sift thru all the dead links - one of them should still have it. What I can't find anymore is the SOURCE CODE to it - maybe someone will be nice and put that up somewhere. I used to have it but lost it in a computer crash and haven't seen it since.

Most agencies nowadays are using RDLAP 9.6K or RDLAP 19.2K. For that, take a look at this site: http://www.cmlmicro.com/products/EvKits/EV9000.htm

Last check (this was a few years ago) they wanted $250 to order one, and it comes with the appropriate chips for testing. Additional chips went for $25 each. I'm sure the cost has gone up since then.

They also sell gadgetry for the other protocol you might be interested in - CDPD. Snoop around their site for the CMX989 chip - that's the one that decodes that. Didn't see an eval board for that, maybe the 9000 works with that as well. A quick email a few years back resulted in source code that worked with the 9000 board that was written in C++, which also fell prey to the computer crash....

I'll be very interested in the results of your quest - I've been itching to try it myself but haven't had the time to play with it yet.

Ditto on the sound & image rejection, and the programming is 180 degrees
from anything else you've ever used, but I kept mine, even though it's the
non-PC interface model. I've learned to program it, and keep a 'cheat sheet'
nearby for some of the functions. With this one, you first program a frequency
and its mode, and THEN assign it to a channel. Some of the functions are
operated differently than other brands as well - the banks are called 'pages'
and the 'scan' button is an on/off thing - you hit it to scan, you hit it again to stop
scanning. I have mine hooked up to a roof antenna, along with all my bases,
but you'll need an attenuator for that or it will overload.

Greetings Group,

I received my BC250D digital scanner. It handles our Motorola Astro system quite well.
It's nice to be able to monitor the police again. If anyone in the NG is using one please comment on the
speaker that is built into this radio. I don't know if it is just mine but, the speaker is crap. It is distorted at anything
over the minimum volume for normal listening. It is next to impossible to hear when in a vehicle. I have resorted to using
headphones most of the time but, this is not a satisfactory solution. One would think that for $370.00 that a better
speaker would be included with the unit. Do any of you know of available mods or replacement speakers?

Thanks and regards
Mark

Man, that sounds bad...pay almost $400 for radio and speaker sounds like
crap...
Might be a defective speaker? Did you contact the place you bought it from?

Recently bought the non-PC version for $80 at a hamfest like new with all original accessories and packing. Neat looking radio. Tunes 25 MHz to 1300 MHz continuous except cell. Like others have said, it's a bear to program. Performance and sensitivity doesn't seem to be terribly impressive off the stock rubber ducky... about par with newer low end Radio Shack 800 MHz handhelds. I'm surprised Sony couldn't do better in the scanner market.

There's a Yahoo discussion group dedicated to the Wavehawk with lots of info.

Hello All,

Looking to purchase a Uniden BC350 that's in good condition.
(any others, I like to have an email with a picture of the scanner
on and working)

Just only need the working unit, no accessories. Going to make
a wide bandwidht receiver out of it.

Any leads please email me

Thanks!

Appreciatively,
~Benjamin

me <LhIU9.26185$ym4.2649597@news2.west.cox.net>...

^ What that program does is use the sound card to decode the old MDC4800 MDT
^ protocol. It's hard to find but it IS out there ...

Thanks, I'll take a look.

^ Most agencies nowadays are using RDLAP 9.6K or RDLAP 19.2K.
^ For that ....
^ Last check ... they wanted $250 ....
^ They also sell ....

Thanks, but I'm retired on a very small pension so I'll have to make do with
what I already have: a scanner and a computer.

Frank

I sold mine a few months ago. Sensitivity was great, especially on MilAero,
but the lousy squelch drove me nuts! Only strong signals could break squelch
and weak signals were very choppy.....

The one I played with at the Ft Wayne hamfest didn't sound too good
either, kind of a cross between a BC245 and my old RS Pro-26. I'm sure
there will be a better speaker that will fit in there, just wait a while
and someone will do it and post about it. I wasn't impressed with the
250 much at all, but I haven't been impressed with a Uniden handheld
since the original TT came out a few years ago.

E,

I am not really on these groups too often. There are lot's of better
informed people here and they love to help the enthusiastic beginner.

I found your post in my webserver visitor records.

Glad I could help.

Want to check out something REALLY cool.....search for info on weather
fax freqs. You can recieve LIVE radio broadcasts from weather
satellites and plug the scanner audio headphone out into your audio
input on your soundcard and run these programs that will decode the
signal into a realtime satellite weather picture on you computer.
Great fun.

There is also proggys out there that will decode some of the digital
siganls that you will pick up. They sound like fax machine noise on
some freqs.

As I am not really a member of this newsgroup, direct any replies to
my email addy.

judgecal1@hotmail.com

Cheers mate,
Cal.

I remember when Uniden first introduced the BC100. The worlds first programmable handheld scanner. I bought one and it did suck! Reception on 42 MHz was mixed with a whine sound. They did let me send mine back and have it refurbished with the newest design and that did correct most problems. I still have the thing. 16 channels and the slowest lcd you have ever seen!!

So maybe the 250D is the same way. Let the bugs work out and then get one.

Ralph

If I understand correctly, you have the video already on a 10.7MHz I.F. frequency?

Since video is Amplitude Modulated, why not try a simple diode-detector??? (Think crystal radio.) I had an old B&W TV many moons ago that used a 1N34 for the detector stage.

It will be mono, but you said you didn't need color.

Let me comment a bit about the Mavicas. I own a couple (FD-81 and FD-91). I got the FD-81 in a swapping, about one year and a haf ago. I valued it at about $300 back then. It was boxed, with all original documents and lightly used. I have done about 1500 pictures so far and it works flawlessly. Some of my WEB page images were made with it (and to publish on the WEB I reduce resolution to about 400x300 pixel, so the 1024x768 size is more than enough; in fact I use 640x480 most times). And you can get pictures focused at just 1" of the object, which is great for detail work (as I do when documenting radio and test equipment repair). Some sample pictures can be seen at:

http://jvgavila.com/xm.htm

I got the FD-91 just last week. I got it at a very good price, $180 (and here in Spain also!). It was more used than the FD-91 but still in great shape (an 8.5 on a 1-10 scale). Its 14x _optical_ (i.e. real, not digital) zoom is amazing. Yes, it 'only' does 1024x768. But at 14x zoom, it is a lot.

I love Sony 'Info-Lithium' Li-ion batteries. They last lots of pictures and tell you, accurately, how much time you have left.

And using 1.44Mb FDDs is also very easy and cheap.

OTOH, I got same time than the FD-81 an HP-215 (1.3 Megapixel). It has an LCD trouble since I got it and the results are always poorer than with the FD-81.

So I recommend Mavicas for everybody who doesn't need higher resolutions.

Just my 0.02 Euro worth, of course.

Regards from Spain,

JOSE

I think they must live on another planet.

Around here analog cells out number digitals. It's probably near a ratio of 60% analog to 40% digital... And like you say, the digital coverage here is fairly spotty, and low and behold when the digital signal isn't available, analog the phone goes... Probably sways the ratio even more towards analog... Go figure...

geez Dick, no need to be an asshole. I was just shocked to see an obsolete camera for that much money. For a few bucks more you can get a used G2 (or something similar), and not have to deal with the terrible lens system in that Sony model, all the problems they had with low light due to the cheap CCD used, the high jpeg compression problems (artifacts) etc etc.

Good luck, i hope you sell it.

Ok, then. Good luck. There's one agency still using the old system here, but they have a data carrier for 9.6K RD/LAP currently being tested now, so MDT Monitor's usefulness, for me at least, is coming to an end.

You will also need to tap the discriminator of your radio for MDT Monitor to do any decoding, if you haven't done so already. Lots of info on the net on how to do this.

If anyone has (or has stumbled across) any mods for the Pro-95, please let us know. I *almost* uncovered a keypad trick to open up certain "blocked" frequencies, but have not been able to reproduce it (I apparently "fat-thumbed" something while using the search mode once and found myself scanning the nether regions...). Any help is much appreciated (needless to say, Google, etc.... returns nothing).

Looking for some direction from someone with some knowledge on receiving
Commercial Marine Frequencies in the range of
2182 KHZ 4125, 4207.5 KHZ -- HF-4, 6, MHZ 6312.

I'm lost here guys, any techies with some direction.
Do I need a special ANT. receiver ? will a IC R7000 receiver do the trick ?
Help !

Actually is IS illegal to listen to cordless phones in the U.S., under
the ECPA (18 USC Sec. 2511)

Section (4) (b) (ii) "if the communication is the radio portion of a
cellular
telephone communication, a cordless telephone communication that
is transmitted between the cordless telephone handset and the
base unit, a public land mobile radio service communication or a
paging service communication, the offender shall be fined under
this title."

In http://trac.syr.edu/laws/18USC2511.html

For those anxious to hear what decoded digital police comms sound like on the
250D, I've got a 5-minute LAPD pursuit of a stolen ("Code 37") vehicle and a
foot-bail from last night. It's in the text box toward the top of my page at
http://www.snowcrest.net/marnells/digital-scanner.htm in wav, rm and mp3
formats.

You'll hear the dispatcher, a couple radio cars, and, very loudly, the Air unit
(helo). None of that typical helicopter background noise anymore, though!

I agree, I have a radio shack amplified speaker in my work truck (van) and it doesn the job very well. I think the original poster may have a bad unit as anywhere else the audio from my 250 is average (as scanners go). I have no problems while walking or while at home hearing my 250.. And most of all, if its a matter of hearing your local systems or not hearing them at all, Ill take it..

687. APCO-25 Digital Scanner Project With Sound Card and ANY Scanner.

Newsgroup: rec.radio.scanner
Date: 2003-01-15 03:09:42 UTC
From: glenb900@hotmail.com
Message-ID: <1de0c1fc.0301141909.37e1cbc4@posting.google.com>
Source record: 38469

Today with the power of the latest computer CPUs and sound cards you can
use your PC sound card to provide advanced digital signal processing
to decode alot of digital modes like WEFAX, HF FAX, NAVTEX, ACARS,
CTCSS, DTMF, Packet Radio, and more all with a standard wideband
Scanner like the Winradio, Icom PCR-1000 or PCR-100, Yaesu VR5000 and
others to name a few.

Why can't someone write a program to use the soundcard to decode APCO
25 Digital Voice Systems?

I heard the APCO-25 is public domain info.

Also what ever happened to a public domain software program that
decoded trunktracker systems for computer controlled receivers like
the ICOM PCR1000?
One program used two radios. One to monitor the data channel and the
other followed the channel hopping user.

It may be more practical to write a program to use one radio like the
Winradio Digital Suite that has the radio listen to the data channel
and switch to the audio channel. When the user switched channels it
would go back to the data channel to decode the data for the next
channel hop.

Some of the best radios to use for digital decoding are:

Winradio models
Icom PCR1000 & PCR100
ICOM R10
Icom R7000 & 7100
Icom R8500 & R9000
Yaesu VR5000
AOR AR3000/AR5000 Plus
AOR AR8000/8200/8600
Realistic PRO2035 with OS535
Realistic PRO2006 with OS456

The best digital decoding software I've see that uses a standard
soundcard
to decode the digital info is the WiNRADiO Advanced Digital Suite but
that one only works with the Winradio and was written by them only for
that radio.

Bonito RadioCom 5.0 is another great program written for other
scanners/receivers like the Icom PCR1000 but don't decode
Trunktracking systems.

What the wideband receiver community needs today is a good programmer that can write software for theses radios to decode atleast trunktracking with a single or dual radio system and APCO-25 Digital Audio. I understand some radios may need a simple mode to get the Discriminator output to properly decode digital signals.

If someone wrote a shareware program for this they would make a fortune $$$:-)

It would be easy for the right person to write a program like the WiNRADiO Advanced Digital Suite plus add APCO-25 Digital but the radio command instructions would be for other radios like the Icom's.

Repost of older posting from this newsgroup about a project that I can't
find any other info about.

My senior design project is to build a APCO-25 Digital Scanner that is capable of decoding the APCO-25 digital bitstream. I have gathered the necessary documents from PUBLIC sources. Since I am working off of public
documents I should be safe. The only problem I have ran into is actually
playing back the digital audio(IMBE Voice Coder), I can get everything else(Unit ID's, Talkgroup ID's, Infrastructure Signalling, Low Speed Data,
Link Control Data, Data Packets, ...).

I got all my info from public TIA (Telecommunications Industry Association,
www.tiaonline.org) Project 25 / APCO-25 documents from my university library.
Actually you have to pay a fee for copies of these standards but since my
university library does that for me, its free....

First off Here's what I have found out.

- APCO25 modulation is a 4-level FM QPSK signal. If you tune your scanner to
an APCO/Astro channel and hook up the discriminator out to a scope it looks
like 4 sine waves that are constantly bouncing around. One thing I have
noticed is that during the beginning and end of calls there looks like its a
fixed pattern or at least a repeating pattern. It turns out that the pattern
is link control frames that are repeated at the end of a call, you can even
hear it, sounds like a buzzing pattern, normally it sounds like a

random
noise.

- Does anyone know if there is a off the shelf IC that does this, I heard a
professor mention a company called MXCOMM? For now I will stick with the
DSP/Sound card method.

- What needs to be done is to build a circuit that can reliably decode those
4-level FM signals. The 4 levels are called di-bits (01, 00, 10, 11). Once
you can decode those di-bits its a matter of assembling that data and parsing
that protocol. (simple isn't it?). I am trying to use the FLEX decoder
circuit that was released to the public (the FLEX modulation method is also
4-level FM, dont ask me for a FLEX scanner since its already done and
publically available).

- To reliably decode the 4-level signal you need to do some pretty complex
math on the data. The modulation sends 4800 symbols/sec (each di-bit symbol
is 2 bits thus APCO-25 has a raw 9600bps data rate. First you need to send
the scanner discriminator signal to a A/D converter then the digital data is
sent to a Intergration and Dump filter routine followed by a Stochastic Clock
recovery routine (sounds simple...) once that is done you get di-bits (the
raw 4-level FM data). This can be done using a high quality A/D converter and
then processing the data. I am thinking about using the Turtle Beach
Pinacle/Fiji sound card since it have very clean A/D's and also has a
Motorola 56000 DSP onboard that can run my code that does the precise 4-level
FM QPSK bit recovery.

From what I have heard, future public safely radio systems world-wide will be
based on APCO-25, in europe its called the Tetra standard. The protocol was
designed by Motorola back in the early 90's and released as a public standard
in 1995 (very unusual for Motorola to make a public standard, they are
usually proprietary). Since then quite a few manufactures are building
APCO-25 radios (Motorola, Transcript, GE/Ericcson ...) The APCO25 system is

used for both conventional and trunked systems. I believe the trunked systems
are still partially analog and the rest is digital. What I mean is that the
control channel is analog (can be decoded by the trunking tracker) but the
voice and data channels are all digital. Maybe someone will interface my
APCO-25 digital decoder to a trunking tracker, that way we will be able to
follow trunking systems that are APCO-25 but still use the old analog control
channel standard. But when the control channel goes digital I will be able to
do all of it in my setup.

To make my project simple I am not going to build a digital scanner that can
work on trunking systems, since the control channel is currently analog. But
that may change in the near future. And also because the calls will bounce
around so much it will be hard for me to debug. For now I will monitor and
try to decipher a conventional APCO-25 system. If I really wanted to monitor
a APCO25 trunked system I would just program my scanner with all the digital
voice channels and listen to those. Although the calls will bounce around..

Ok to the protocol. If you have a clean capture of the 4-level fm signal the
one thing you will see often is a frame synchronization pattern. According to
the documents its 48bits in length and is hexidecimal (0x55, 0x75, 0xf5,
0xff, 0x77, 0xff). Those frame sync's seperate the frames of data. This is a
key element since if you have detected that pattern it means your 4-level FM
recovery routines are functioning properly.

- each APCO-25 voice call is composed of a series of data units: 1 Header
unit followed by Logical Data Unit 1 and Logical Data Unit 2. Those LDU's
repeat until the end of the voice call. At the end of the voice call there is
something called a terminator data unit.

- what distinguishes a voice frame from a data frame or a terminator frame is
something called a network ID. This network id is 64 bits in length and is the
very first piece of data after frame sync. It basically tells you what type of
packet it is (Header, LDU1, LDU2, Terminator, Data).

- within each LDU packet is the actual IMBE voice data, link control data
(source ID, destination ID, manufacture ID, talkgroup ID, ..), Low speed data
(dont know what this is for), and encryption sync(key ID, algorithm ID). I can
basically get all this data with my parsing routine. I can tell what radio is
keyed up, who they are talking to, and the various signalling messages sent
(emergency, pages, messages,...). I have the raw IMBE voice data but dont know
how to turn the IMBE packets into audio.

- Each LDU contains 9 IMBE packets, each IMBE packet is 144 bits in length,
88 of those bits are raw IMBE voice data. Each IMBE frame represents 20ms of
audio. It seems like during the beginning and end of a call the IMBE frame is
fixed.

- There is only one header packet during the beginning of any APCO25 voice
call. This header unit contains a encryption synchronization pattern,
manufacture ID, encryption algorithm ID, Encryption Key ID, and Trunking
talkgroup ID. It seems like the encryption related data is fixed where the
call is not encrypted (the encryption sync pattern appears fixed and does not
look random).

- Data frames are trellis encoded, I have a TIA APCO-25 document that saids
something about future trunking control packet being based on Data frames. I
guess they encapsulate trunking signalling into data frames. There are
basically 2 types of data frames 1/2 rate and 1/3 rate trellis encoded
packets. The first data frame and all standalone data frames are always 1/2
rate trellis encoded. Subsequent data frames can be 1/2 or 1/3 rate trellis
encoded depending on what type of data call it is. The types are

confirmed
(acknowledged) or unconfirmed (unacknowledged). You see with 1/2 rate
encoding 1/2 or your data is forward error correction data. With 1/3
rate 2/3
is data and 1/3 is forward error correction. You loose alot of
efficiency
with 1/2 rate, but it is more reliable.

I guess all we are interested in is to hear the Audio. Thats what I
dont
have. IMBE stands for Improved MultiBand Excitation. It is basically a
Voice
Coder. It is designed to take 20ms of 8Khz samples with 8 bit
resolution
voice and turn that into 144 bits with decent voice reproduction. Now
thats
pretty dam good compression (8Khz * 8bits / 1000bps * 20ms =
1280bits/20ms,
for IMBE its only 144bits, that about a 9x compression).

Note IMBE is designed for Voice, not Music or Tones. Its modeled after
the
english speaking male human vocal track. IMBE was developed by DVSI
(www.dvsinc.com). The IMBE vocoder used in APCO-25 is a rate 4800bps
vocoder.

In APCO-25 all of the data is highly protected by forward error
correction
routines (hamming, reed-solomon, golay, trellis). I wont go into any
detail
here. But one must understand these error correction encoding methods
to
extract the raw elements. They are all there (the raw data), you dont
really
need to forward error correct the data. To do forward error correction
codes
would require alot of CPU power.

Now DVSI sells a DSP board called the VC-20 that can decode/encode
IMBE. It
costs big bucks (between $1000-$2000). Its basically a TI DSP board
with
their IMBE vocoder onboard. You feed it IMBE frames and it generates
analog
audio, it can go the other way.

Now if someone kindly donates one of these boards to me I will have a
fully
functional APCO25 scanner. please... please... please... :-) I might
even get
my other college associates to try and port the IMBE algorithm to a
Windows

95/NT multimedia audio codec. DVSI, were just kidding..... hate to
image
doing something illegal.... :-(

Now if the IMBE voice is encrypted we are out of luck, sort of...
APCO-25
calls for a the DES encryption method with 56bit keys. I guess there
are
public domain DES rotines out there, anyone what to try and decode a
DES
encrypted call, might take years. I have a theory, since I have
noticed that
IMBE voice calls always begin and end with a fixed pattern we have
information that makes it tons easier to decrypt. We can try different
keys
on the data until it matches this fixed pattern at the begining and
end of
the IMBE voice call... once we have the key its simple to run the DES
decoder
and get the raw unencrypted IMBE voice data.

Image this, hook up your scanner to my 4-level FM recovery circuit,
the PC
will process the signal and produce di-bits, my parser program will
display
all the APCO-25 signaling data, and the IMBE will be routed to a
Windows
Multimedia Codec to be played out on the speaker... What a dream...
Its
possible, I am almost there...

Maybe Bearcat will hire me when I graduate and buy my senior design
project.... or maybe I will give it away for free to the public....

Any comments or suggestions?

Image if we build on this project, we could write this as a Active X
component, that will let any windows programmer write around these
routines.
We could log all public safety calls, scan for radio Id's in our
programs,
record and playback audio for a specific unit id. Listen for emergency
alarm
signalling packets......

More to follow..

Do a search for Novus 1-2-3 scratch remover kit. Works great

&rd=1

Acution closes Jan-20-03 21:18:55 PST

30 channel mobile scanner from Regency. Good condition and clean. Works
well. Just upgraded to a trunking scanner, no longer need this unit. The
MX-3000 is an excellent workhorse scanner. Built for a mobile environment.
Features a top-mounted speaker and loud audio.

Programmable - 30 channels

30-50, 144-174, 440-512 MHz coverage

Search

Priority

Delay

Backlit keypad for night operation

Night/Day/Off modes for display and keypad

Flourescent display

Auction also includes:

Heavy duty OEM mobile bracket with knobs

144/440 dual band rubber duck antenna

BNC-Motorola adaptor

Right angle BNC adaptor

9v battery for memory back-up

Pre-wired for connection to your car's electrical system - freshly crimped
connectors

Operation and programming is simple and straightforward.

All that's required to get this scanner up and running is either a mobile antenna for the car -- or -- a 12v power supply at home.

I've cleaned up watch crystals with tooth paste just using the tip of my finger in a circular motion as you would when compounding automotive paint with a buffer. Don't let the paste get too dry, use enough water to keep it from scratching/fogging more.
You might practice on something that's dispensable to get the feel of it.

The MDT program and source are out there...massaging the source for operational use could not be all that difficult...one other item you might be interested in looking into is in some of the major transit areas of the USA, there are devices that utilize an LCD display device that looks like a fishfinder. It is coupled via cabling into a two-way radio and various hardware interfaces to enable data transmission with GPS coordinates. Pre-canned text messages are included as well as voice call too. Some use MSK transmission medium and other places utilize GMSK for 9600 baud rates for faster polling schemes. In Chicago, the emergency beacon is transmitted OTA with DTMF coding! And if you have a built in DTMF decoder, you can find the vehicle ID and some parsing work, even work out the location of that vehicle to within 100 meters of the actual vehicle location. Some are on trunked radio systems, some are not. Most are viable, operational and HAVE saved lives.

Let us know how well this antenna works.

Another option for both VHF and UHF air is the Watson W-901, or if you can get hold of one, the stock antenna for a Yupiteru VT-225.

They could very easily. But without a vocoder board (which would cost you
more than a 250D) you would not have much use for it.
>
> I heard the APCO-25 is public domain info.
It is. But the VOCODER technology however, is NOT. A patent search might
turn up some schematics that you could use but converting schematics to a
sound card program is no easy feat - my hat goes off to the FEW hobbyists
that have done it.

> Also what ever happened to a public domain software program that
> decoded trunktracker systems for computer controlled receivers like
> the ICOM PCR1000?

It's still around. You can find it on www.trunkedradio.net

> What the wideband receiver community needs today is a good programmer
> that can write software for theses radios to decode atleast
> trunktracking with a single or dual radio system and APCO-25 Digital

Again, without hacking the vocoder as well, you're asking for a useless
product. Well not useless - a true scanner geek such as myself would get all
giddy logging preambles and data frames...

>
> If someone wrote a shareware program for this they would make a
> fortune $$$:-)

No, you would get sued into oblivion. Look what happened to the guy who
wrote Winflex - and that program was freeware! You are not only talking
about pissing off Motorola, but now Uniden and AOR too - all of whom would
lose money from such a "program". And the makers of the vocoder technology
that goes into EVERY digital radio and scanner would want a piece of the

action too. By the time all those vultures picked your carcass clean, you *might* have enough money left to catch a city bus to the homeless shelter, if you can fit the barrel you're wearing thru the door.

>
> It would be easy for the right person to write a program like the
> WiNRADiO Advanced Digital Suite plus add APCO-25 Digital but the radio
> command instructions would be for other radios like the Icom's.

Easy he says. Clearly you have never written a computer program of any real substance and don't know what it takes to do so. There's only one way to learn: Do it. Here's how:

I take it you know c++? If not, LEARN IT. It's a MUST for studying the work of those who went before you, as all of their code was in c++. I then suggest locating on the net source code for POCFLEX, Winflex, trunker and MDT Monitor. You will then need a couple hundred $$$'s for the necessary "public documents" you eluded to and well, you might as well throw in $600 more for a 250D (so you can run side by side comparison tests in the debugging stage) Knock yourself out - we'll hear back from you in a year or two.

-me

Two main reasons:

1) I don't use Windows (and won't)
2) "minus cell"

Forgot to mention, I mailed Don Starr about his program asking if he might consider releasing all (or at least part) of the source to his software so we might be able to produce a version of this that is somewhat cross-platform, but that was about a week ago and havn't heard back yet. I suspect I probably won't (and I'm not surprised, really). I also asked whether or not he planned on releasing versions of his program for other OS's in the event that he didn't want to release his code.

The least he could have done was replied.

> listen to cell - get an old radio that will work with cell freqs.

To be honest, it's not that big of a deal to me to have access to cell
freq's specifically, since scanners that do receive them are a
dime-a-dozen anyway. I did notice, though, that there are various
"tricks" that can be done with the keypads of certain scanners to
produce different effects (unblocking freqs being only one of them).

Basically just looking for the "undocumented stuff".

> If you want a keypad trick, try this one. When you turn on the radio, you get

Keep in mind, however, that sensitivity outside the original ranges
might be greatly reduced to to filtering.

Source record: 38297

Ok, please bear me out.

I live in Kansas City, MO (in the city, not suburbs --15 blocks north of 435 just off Wornall for those who know the city). 99% of monitoring is of KCMO's 800mhz public safety EDACS system. The vast majority of KCMO traffic is clear to very clear even with the rubber duckie in my basement. I would like to monitor, on occasion, Lawrence, KS (home of KU Jayhawks) which is approximately 35 miles west. I can't receive Lawrence (866-8068 mhz MOT II, I believe) at home, but can pick it up on the edge of Johnson Co. KS(within 5-10 miles from my home) with a roof mounted cellular antenna .

On several web pages, I have seen people that have a discone with a yaggi attached. Would this be a good combination to try? Would I have at least a reasonable chance of extending my range that extra 5-10 miles? If so, does anyone have a good resource for how to mount such a beast to my roof. I know its probably not that difficult, and I could probably do it without out help, but some tips or tricks are always helpful the first time.

Finally, if I do install an outside antenna, am I better off mounting the mast on my roof (no restrictions to worry about that I know of) or placing it in a large oak tree in my front yard. Obviously, the tree branches and leave would seem to cause some interference, but I could probably mount the antenna an extra 5-10 feet higher using the tree & the mast would be somewhat protected from strong winds. My gut tells me that the unobstructed roof installation is probably better, but I don't really know.

Thanks

-derek ward

The baseband filtering in the scanner audio will cut off the high's and lows in the datastream that the program uses to determine a 1 from a 0 at that speed.

Just to add to this thread a little, the MDT Monitor program is out
there. You can get it off of the following sites (that I know of).
What I am in need of is the original source code or at least enough of
it to figure out the dll functions in MDTData.dll. Here are the
sites:

ver 1.5.1
ftp://ftp.pspt.fi/ham/ftp.ucsd.edu/packet/tcpip/incoming/mdtmon151.zip
http://www.albany.net/~ceraldi/scanner/software.html
ver 1.6.1
http://au.geocities.com/ben112233/

Now can someone please come up with at least the library files from
the source code? It sure would help me!

Colocat

Wish I could help ya - I used to have it, and I wrote a really cool custom version of it that looked like an actual MDT, and, simply by pressing the spacebar, would bring up a map of the incident it had logged. I loved that - then my computer crashed and I lost it. Been looking for it ever since.

MDT Monitor was by far the coolest homebrew program ever written for scanner enthusiasts. I remember when I first ran it - I stayed up literally all night watching 3 different police agencies data systems and went to work that day feeling like a zombie... Gordon, if you're still lurking here, thanks a million for that great program!

Where can you get an IMBE vocoder board? Is there an IMBE vocoder chip
available?

One thing which appears to me is that the 250D seems to be somehat
hyped up and overrated: It does not work with 9600 baud trunking
channel which appears to be the recommended APCO implementation. It
only works with 3600 baud, which (please correct me if I am wrong)
appears to be similar if not identical to Motorola Smartnet (Type II
trunking), and is used only as a transitional system (basically APCO25
implanted upon existing Motorola trunking networks).

It appears that all the 250D does is standard Motorola Type II
trunking. To do the C4FM demodulation and IMBE, you need to buy the
extra optional module for $300.

So, if my above assumption is correct, then all one needs to emulate a
250D is any existing scanner capable of Motorola trunking (such as the
Winradio with their Trunking Option) to do the control channel
decoding. To receive the audio channel, one would need to add a C4FM
demodulator with an IMBE vocoder board. What do you think, would this
be workable?

Greeting Scanner Enthusiasts:

New to the recent market of incident notification is a group called ENN.net located at www.e-n-n.net

We are curretnly recruting enthusiasts in the following area: Delaware, Eastern Pennsylvania, Eastern Virginia, New York State, and the District of Columbia.

ENN.net is specializing in breaking news as well so for doing news reporting there is no geographical restrictions.

Anyone interested in a position, or more information should contact Comments@e-n-n.net

Thank you for your time.

722. FS: [Book] Guide to Old Radios "Pointers, Pictures and Prices"

What is this, your own little personal sales board? The scanner I can live with, but trying to pawn off your digital camera is WAY
of topic.

Agent Frank (???),

Normally this is where we insert the Standard Form Letter PQ-22/T to
the effect that we are currently busy processing the requests from
numerous other police or government agents who frequent these
newsgroups, trolling for proscibed data and other admissions of guilt.

In your case, however, we can't, as your request belies a rather
shocking ignorance, a distrubing reflection of what must be lowest
training standards at the FBI, CIA, DEA or wherever you work, we have
personally seen to date.

Good grief, you apparently can't operate 'google' properly!

Even worse, you are seemingly unaware that basic agent provocateur
operating procedure is to _offer_ something to your investigatory
targets -- this is the beginning of the trust that you can take
advantage of (or otherwise abuse) later. Just demanding guilt from
the start is, shall we say, rather obvious. And pouting about the
lack of response ("which is rare") only makes you look pathetic.

Now given recent events where El Preseident Jorge (II) can, with the
swish of his mighty pen, declare anyone, for any reason, an "enemy
combatant" and have him "disappeared" (not even the pretense of a
trial is required anymore), we suspect that you'll have to offer
something fairly substantial before anyone will be willing to share
their secret websites and other illicit informational caches.

Please, for everyone's sake, do not embarras yourself further in this
matter. It just puts the entire justice system, the very government
itself, into an even worse light (if such a thing is possible at this
point).

Thanks.

P.S. Kindly give our warm regards to Herr Asscruft!

ID Tracker has been updated to support then BC250D. As
usual the source code is also available.

http://bellsouthpwp.net/k/d/kd5eis/IDTracker/IDTracker.htm

I have not tested tracking digital radios (I do not have the
digital cards) so I am not sure how that will work.

[snip]

The scanner is actually not capable of receiving cell frequencies. If
you try entering a cell frequency via software, the scanner will
reject it. This is hard-wired into the firmware.

Don did include logic to round frequencies out of the cell band, but
just because that's preferable to getting an illegal frequency
response.

Earlier versions of Win93 and Win95 had similar logic for the other
excluded bands, 'til Don discovered that you could load them with no
problem. You still have the problem of poor sensitivity outside the
advertised bands, but the CPU is perfectly happy dealing with them.

>>The least he could have done was replied.

He has replied to that scores of times on the PRO-93/PRO-95 Yahoo!
group, where the lion's share of discussion (and support) occurs.
Check the archives for that discussion and the reasons.

Don is *extremely* generous with his time in responding to users of
his software.

FWIW, Windows emulators are available for other platforms. IIRC, there have been reports of Win93 or Win95 being successfully run under emulation on Macs.

I installed an AM/FM CD radio that has an AUX input. I hook the AUX input to my scanner and have the
sound coming out my the truck speakers, it sounds great. The AM/FM CD radio has a button the select
from AM/FM radio to CD to AUX. If you going to install an AM/FM radio, look for one that has an AUX input.

Is there anything like this, but for non trunking radios, that would put the id tags and info on the screen.

Example.

BC760 Xlt Uniden radio.

413.5375 OPP Non conventional talk ch. (No trunking here, just straight analogue simplex talk.

translate to:

413.5375 OPP BEAT REPEATER - TORONTO OPP - DISPATCHER CALL - UNIT 2023

blah blah blah, you know what I'm trying to get at with this.

I notice there's lots of programs out there for scanners that use these.

Just thought I'd ask.

* * THE ULTIMATE CELLULAR MODIFICATION MANUAL * * released by * * %%%%%%%%
Dr. Bloodmoney %%%%%%%%%% * * June 1, 1992 *
*****************************************************************************
* The following information was gathered from various sources and is not
meant to be a technical treatise on the cellular network. There are plenty
of other files out there on the subject. This file specifically deals with
the processes involved in modifying cellulars. I put together this file
because I have not seen one that actually tells how to do this. When some of
you start reading this you might say to yourselves "Hey, some of this is
almost word for word from Brian Oblivion's article (incidently, one of the
best I have seen on the subject) in Phrack #38 or so and so's article in so
and so magazine". Well, not to discount anyone who has written anything on
cellular phones, but all the information in this file was purchased by me
from various ads in the back of various radio and communications magazines.
I make no pretense as to where the original source of this material comes
from. In fact, most of the t-files I have seen contain some of the
Consumertronics info. word for word, and the writers try and claim it as
their own. Or maybe vice versa. I make no claim to have written this manual
(but beleive me after putting this together I could). The only thing I have
done is spent many hours compiling what I believe to be a very good file on
the subject.

*****************************************************************************
* Comments can be left to me at RIPCO (bloodmoney),Blitzkrieg,or Lucid
Dreams PART I. WHAT IS BROADCAST FROM A CELLULAR TOWER? When a cellular
phone makes a call, it normally transmits it's Electronic Security
Number(ESN),Mobile Identification Number(MIN),it's Station Class Mark(SCM)
and the number called in a short burst of data. This burst is the short buzz
you hear after you press the SEND button and before the tower catches the
data. These four things are the components the cellular provider uses to
ensure that the phone is programmed to be billed and that it also has the
```

identity of both the customer and the phone. There are usually two cellular phone companies in an area. One is the wire-line carrier (Band B), which is usually Bell, and the other is the non-wireline carrier (Band A). Within the two bands are 832 cellular phone channels. Each one has 416 bands, and within the bands are voice channels that actually transmit and receive information from cellular phones. The ESN and the phone number (MIN) are the two primary identifiers for any cellular phone. By changing both, the cellular carrier will accept the call and bill it to either a wrong account or provide service based on the fact that it is NOT a disconnected receiver. It will also look at the other two components, in order to insure that it is actually a cellular phone and to forward billing information to that carrier. The Station Class Mark can also be changed if you wish to prevent the cellular carrier from determining the type of phone that is placing the call. By providing the cellular tower with a false SCM, the cellular carrier, the FCC, or whoever happens to chase down cellular fraud is often looking for a particular phone which in reality is not the phone they are looking for. For example, you can provide the SCM for a Radio Shack phone, when in reality you are using a Novatell (How this is done from changing the SCM I do not know...remember...I didn't write this). The Number Assignment Module (NAM) also has the SIDH (System Identification for Home System) number programmed into it. Refer to SIDH TABLE. The transmittal of the SIDH number tells the carrier where to forward the billing information to in case the user is "roaming". The SIDH table tells the major cities and their identifying numbers. Changing an SIDH is programming job that takes only minutes, but be aware that the ESN is still sent to the cellular phone company. After they realize that the ESN is connected to either a fake number or a phone that is not in the network, they will block service. They only way around this is to reprogram the ESN.

****

* PART X. A FEW COMMON SCANNER MODIFICATIONS Here a few scanners and what it takes to modify them. If your scanner is not shown here, don't worry. Ham Radio BBS's are all over the country. You should be able to find the instructions for modifying your scanner there. Restoration of Cellular Frequency Coverage on Radio Shack PRO-34 Handheld Scanner 1. Remove battery cover and battery, four black screws on rear cover, and volume and squelch knobs. 2. Remove rear cover, lifting back and up to clear controls. Do not remove belt clip or circuit board screws. 3. Unplug the brown volume control connector (grn/yel/blk) and white squelch control connector (wht/blk/red) from the linear circuit board. 4. Unsolder the ground lead from T111 (at corner of linear circuit board above the external power connectors). Unsolder the two power switch leads from the back of the volume control. Unsolder the antenna connector center pin and ground wires from the l 5. Unscrew the four combination screws that hold the linear circuit board and received the back cover screws. Grasp the linear board at the top and lift it straight away from the front case, unplugging the 16-pin connector. 6. Remove the three screws holding the metal frame assembly which held the linear board to the front panel. Unplug the red-black power lead and lay the frame aside. It is still connected to the battery contacts. 7. Locate diodes D9 - D12 on the volume control side of the of the logic circuit board under T1; D10 and D11 are marked. Clip one lead of D11, separating the gap. This

may be resoldered later if desired. 8. Reassemble the board by reversing the disassembly procedures above. Restoration of Cellular Frequency Coverage on Radio Shack PRO-2004 Scanner By cutting diode D513 on the PC 3 sub chassis in the Realistic PRO-2004 Scanner you can re-enable the 825.00 to 845.00 and 870-00 to 890.00 frequency selection. To scan in 30KHZ steps press "STEP-RESET". Restoration of Cellular Frequency Coverage on Radio Shack PRO-2005 Scanner 1. Unplug the radio 2. Remove the screws and take off the top cover. 3. Look for D502 on the inside right hand-side of the front panel. (No need to unsolder the silver plate protecting the vertical board!) 4. Simply cut the diode and reverse the process. Aren't you glad I only chose to cover Radio Shack models. I'm sure you appreciate the fact that I only deal with quality merchandise. If you have some cash to blow (like $500), I would recommend buying the ICOM R-1 handheld scanner. It scans from 1 to 1400 in 1/2 step increments and already includes the cellular frequencies. Plus is is about as tall as a box of 3.25 floppies and about as wide as a 16 oz. coke bottle. It is the smallest and one of the more powerful hand-scanners around.
****
* PART XI. THE 40-50 MHZ CELLULAR SCANNER The cellular phone freqs. occupy the UHF spectrum previously assign to commercial TV stations. Since a TV channel occupies a Bandwidth(BW) of 6 MHZ and each cellular channel requires 24 KZ (for a plus and minus 12 KHZ signal) and a 3KHZ guard band for each audio signal (thus the 30KHZ spacing). 200 cellular channels can fit into one UHF TV channel. Thus, with a little fine tuning, and old TV set with variable VHF tuning can tune in all cellular freqs. between 824 and 890 MHZ. UHF TV tuners ares designed to convert these UHF freqa. to intermediate (difference) freqs. between 41 and 47 MHZ. Thus, by purchasing a commonly available UHF tuner (check sith a TV shop and try to get a copy of the SAMS for powering the AFC info, and avoid those with tubes). Tuner voltage is usually 8-24 volts, and must be correctly connected up. You should also remove with the tuner, the TV's channel select and fine tuning controls for ease of use - and they should be in good condition. Once you have the tuner, you can then wire it between a 30-50 MHZ scanner and a UHF antenna (highly directional yagi type is preferred). Since the tuner will probably have a 300 ohm input impedance, a twin antenna cable is preferred (Yes Radio Shack has 'em). If you are into directional-finding, the UHF antenna should NOT have AGC (automatic Gain Control) as those with active AGC will amplify reflections, resulting in readings from so many directions that the target will be lost. Because of the use of inconspicuous, commonly available, inexpensive, high-gain UHF antennas, using a good UHF tuner to scan cellular channels is a good method of doing it. Tuner output is usually through an RCA-type plug. CAUTION: BE SURE TO COUPLE YOUR SCANNER TO THE UHF TUNER WITH A 0.01-0.1 mf (50 V min.) CAPACITOR FOR DC BLOCKING. AND DO NOT TRY TO OPERATE THE TUNER THROUGH ITS TV SET AS THE DANGER OF HIGH-VOLTAGE DISCHARGE IS HIGH. Also, connect a ground wire between the tuner and the scanner. The table below describes how cellular freqs. can be downconverted by a commonly available UHF TV tuner (all freqs. are in MHZ) CELLULAR MOBILE FREQS & SCANNER EQUIVALENTS TV BAND CELL. CHAN. SCAN TV OSCIL CHAN. # and FREQ. FREQ. FREQ. LIMIT ----------- ------------ ----- -------- ----- 73 (first) 0001-825.03 45.97 871 824-830 73 (last) 0166-829.98 41.02 871 824-830 74

However, most UHF tuners have a fine tuner that can be adjusted up to about another 6 MHZ. Note that the term "first" and "last" refers to the first and last cellular channels receivable by the UHF tuner for the given TV channel. Base voice channels are monitored when both sides of the conversation is required. Mobile voice channels or base control channels are monitored to locate a cellular phone. Tuning is simple: (1) Decide which cellular channel or freq. you wish to monitor. (2) Find what UHF channel includes that freq. and switch the TV to that channel. (3) Using the table, look up the corresponding TV oscillator freq. (ex: 919 MHZ for TV channel 81). Subtract the cellular channel freq. from the TV oscillator freq. (4) Tune your scanner to the difference freq. When you select a scanner, you should pick one that will scan in 30 MHZ increments to efficiently receive cellular transmissions. If you can't get one like that, then get one that will scan in 15,10 or 5 KHZ increments.

****

* PART XII. HOW THE ESN IS REPLACED It takes some electronics skill to pull or unsolder the ESN. If you are sketchy about messing around with your phone, I suggest practicing on something else first, like an old calculator or something. It is also a good idea to use the proper tools (A very small soldering tip,chip pullers, It is imperative NOT to touch any of the surrounding connections, soldering joints, or chips. The job MUST be done right the very first time. After that it is not so important, because after the first time you should have the ESN information stored safely to disk. The only dangers remaining are physically damaging the chip. (Note: There are devices that wipe PROMs clean in the event of programming errors). When removing the ESN, try to follow these 5 steps: A. Remove the PC board containing the ESN from the entire phone unit. The boards are usually screwed in with Phillips heads. This will insure against damage to the rest of the unit. B. Ascertain the correct chip. Find the letters on the chip, and check it against the letters from the IDENTIFYING THE ESN section. Refer to the .Gif file included if necessary. C. It is a good idea to draw a sketch to help you remember which way the chip went in. You may laugh, but do it anyway. D. Carefully remove the chip. Take your time and use the proper tools. E. Solder in a zero insertion force (ZIF) replacement, so that replacement chip can be changed easily. After the ZIF socket has been

successfully soldered in, reinsert the ESN and attempt to make a phone call (Be sure the NAM is programmed correctly). If it doesn't, check the leads on the ZIF to insure that you have soldered them correctly. After that, insert your ESN into your PROM reader and make sure it provides some sort of reading. You should use the search mode to look for the manufacturers serial number. (see MANUFACTURER'S ESN CODE LISTING) to identify the address on the PROM where to reprogram the ESN.
****
* PART XIII. EQUATIONS FOR PROGRAMMING THE CHIPS In most instances, you will not be able to tell the code on a PROM because the manufacturer will have blown the security fuse in order to prevent people from obtaining the codes to reprogram their own chips. Therefore, it might be necessary to produce a set of equations that are programmed into the cip to produce a bogus ESN. The bogus chips must contain the first three digits of the manufacturer's code listing, which is consequently the first marker of the actual ESN. Experimentation might be necessary, but hey, isn't that half the fun? With the aid of an EPROM emulator, the whole process should be able to be completed in under an hour - this includes pulling the chip, creating a new ESN, programming the chip, and replacing it. So know you're saying "Holy Cow this project is getting expensive!". Well it can get that way, but the long run payoff is worth it. I have seen both emulators and burners for under $200 (I'm not talking about those spiffy models that program RAM, just the basic EPROMs...in fact I can buy them for under $150. Same with the emulator. Just look around.) I wouldn't be surprised if actual ESN data started appearing on boards in the near future. I know when I finsish my phone (Hopefully soon) I plan on U/L the ESN info somewhere.
****
PART XIV. MANUFACTURER'S ESN CODE
LISTING ----------

* PART XVI. "THE ROAMING SCAM" Some people who are playing with phones that have been originally registered but have been turned off for non-payment of bills have used the "Roaming Scam" to place free calls. NOTE: The cellular carriers will still have records of these calls, and will prosecute those they eventually catch up to (yeah,right). However, industry standards have shown that they pursue less than one percent of the fraudulent calls placed. It is far more economical for them to build software and hardware traps to prevent unbilled calls from being placed rather than attempt to collect on the other end which involves greater amounts of personnel and manpower with smaller actual collections. People have performed the roaming scam by taking their phones into areas where the SIDH numbers are different from the ones currently programmed into their phones. Refer to the SIDH listing in this file for the codes for particular cities. By reprogramming the NAM and inserting a fake SIDH, the cellular carrier will often accept the phone call, but on occassion the user will get a message that the phone must have a local code in order to access the system. As cellular carriers grow larger in size, this message is less frequently heard. At this point, the cellular carrier instructs the user to contact them. I don't think so. The cellular service has the best chance of of catching a spoofer who either calls a friend continually at home or by developing traceable trends such as calling the same number from within the same cell at the same time every day. Or doing something stupid like ordering a Pizza. "But I want to hook up the phone to an acoustic coupler, d00d, and call all the k-rad out-state-boards for the latest PyRut WaR3z!4@$$!$@!@" <-lamer. Well, one of the properties of cellular phone systems is that the transmitter freqs. may be changed or "hopped" in the constant effort to allocate freqs. Because of freq. hopping it is very difficult to triangulate a cellular phone using standard directional finding methods (trace you, d00d). Further, it is known that a directional antenna randomly aimed at cellsite repeaters will confuse directional finding equipment being used by them that is synced to their freq. hopping scheme.

DEFINITIONS The following is a list of commonly used abbreviations used in cellular phones. SIDH A 15-bit field in the NAM designating the System Identification for the Home System. Bit 0 of the SIDH corresponds to the Preferred System flag used elsewhere in the NAM. Bits 6 and 5 of byte 0 are international code bits. Normally the SIDH is entered during programming of the phone as a 5 digit decimal number. Enter 0's to the left-most unused positions when reprogramming. L.U. Local Use Flag. Tells the cellular phone user if it must preregister with the system. Preregistration with the system means that a mobile must transmit its parameters to the Cellular System as soon as the power-up task and the control channel tasks are completed. "1" enables the flag. Usually set to "1". MIN MARK A 1-bit flag designating that MIN2 (area code) is always sent when making system access. "1" enables the flag. Usually set to "1". MIN2 A 10-bit field representing the area code of the mobile ID number. MIN1 A 24-bit field representing the mobile telephone number. MIN2 plus MIN1 equals MIN, the 10-digit phone number. SCM A 4-bit field designating the Station Class Mark. A (3-Watt) 832 channel mobile unit typically will be 1000, a 1.2 Watt portable 1001 or a 0.6 Watt handheld 1010 or 1110 (discontinuous transmission, meaning push-to-talk). These are class I, Class II and Class III power levels respectively. With the SCM the cellular system determines whether or not a cellular phone can be switched to one of the 156 channels. Bit-1 is "0" for 666 and "1" for 832. (See cellular freq. list) Bit-2 is "0" for a mobile unit and "1" for a voice-activated transmit. Bit-3 and -4 identify the power class of the phone: "00" = 3.0 watts "01" = 1.2 watts "10" = 0.6 watts "11" is not assigned IPCH An 11-bit field designating the initial paging channel to be used if in the home system. Normally it is 334 for wireline systems, 333 for non- wireline systems. But most phones allow other settings for test purposes. ACCOLC A 4-bit field designating the overload class for the cellular phone. The intention of this entry is to allow the Cellular System to be able to determine priority in the event of a system overload, however it is currently useless as the system operators have generally not provided guidance for thier installers. The usual (and correct) system now in effect (in U.S.) is to use a "0" plus the last digit of the phone number. Test phones should be set at "10",emergency vehicles at "11","12" through "15" are reserved. (A class 15 system is supposed to be

police, fire, or military). P.S. 1 1-bit flag designating the preferred system. If PS is "0", channels 334 through 666(EVIL!!!) are used. If PS is "1" then channels 1 through 333 are used. Even numbered system numbers (B systems) require a PS of "0", odd system numbers (A systems) require a "1". GIM A 4-bit field designating the Group Identification Mark. This number tells the Cellular system how far to look in the SIDH to determine if it is roaming in a system which may have a roam agreement with the phone system. It is usually set to "10". LOCK DIGITS A 4-bit field designating the unlock code. The digit "0" in the lock code is represented by an "A" in the actual NAM hexidecimal data. A lock code of all "0" sometimes unlocks the cellular phone.(Note: Lock codes are 3 digits. When programming a phone use "0" as the first number.) E.E. A 1-bit flag designating that end-to-end signaling is enabled. End-to-end signaling means that the DTMF tones will be transmitted on the voice channel as well as being echoed on the handset. This feature in necessary for such services as Bank by Phone, activating answering machines and in third party long distance services such as Sprint and MCI. A "1" enables the flag. Usually set to "1". REP A 1-bit flag designating that repertory memory (speed dialing) in the cellular phone is enabled. And once a again a "1" enables the flag. H.A. A 1-bit flag designating that the horn alert feature in enabled. "1" enables the flag. H.F. A 1-bit flag designating that the handsfree option is enabled. A "1" enables the flag. Often, transceivers supplied as hands-free units require that this flag be left at "0".
****
* PART III. TYPES OF NAMS NAM Types Used in Cellular Phones NAM- Number Assignment Module - A 32 word by 8 bit PROM The NAM contains all the information that can be programmed to the phone directly from the handset. (i.e. SIDH,MIN,LOCK-CODE,etc.). All phones except NEC will accept tri-state NAMs. NEC requires an open collector NAM. Fujitsu phones will accept either open collector or tri- state NAMs. Brand Qualifications: Fujitsu and Alpine phones will not operate properly with any Harris Brand NAM or with any Signetics brand NAMs with a part number NOT ending with an "A". TI NAMs must not be used in GE Star models. Panasonic has suggested only TI NAMs should be used in their phones. NAMs are available in ceramic (F) or plastic encapsulation (N). BRAND OPEN COL. TRI-STATE OPEN COL. TRI-STATE

EXCEPT 18 FOR MANUFACTURERS OPTIONS 19 1A 1B 1C 1D NAM CHECKSUM ADJUSTMENT
1E NAM CHECKSUM 1F The Checksum Adjustment and Checksum are calculated
automatically after the data has been edited for the NAM. The sum of all
words in the NAM plus the last two must equal a number with "0" in the last
two digits. The radio checks this sum and if it isn't correct, the radio
assumes the NAM is bad or that it has been tampered with. * - These bits are
used only by AT&T,Hitachi and Mitsubishi. They are A/B Enable and Roam
Inhibit. They must be "0" for all other models. ** - My information does not
agree here. One source claims that address 03 has 6 bits and that address 0D
has 7 bits. The other source states the the exact opposite.
****
* PART V. STANDARD NAM FORMATS NAMs are generally mapped the same in all
cellular phones, and the ones that have no "fancy" options are generally
programmed the same. This chart provides the usual digits and settings for
almost every NAM. ITEM DESCRIPTION NO. OF DIGITS USUAL
SETTING ----------
------ 1 First 3 digits 3 XXX of phone number 2 Last 4 digits 4 XXXX of
phone number 3 Lock Code(LOCK) 3 or 4 XXXA or XXXX 4 Area Code (MIN2) 3 XXX
5 Home Area System ID No. (SIDH) 4* XXXX 6 Horn Alert (HA) 1 0 or 1 7 Hands
Free (HF) 1 0 or 1 8 End-to-End Signaling 1 1 (EE) 9 Repertory Mark (REP) 1
1 10 Group Identification 2 10 Mark (GIM) 11 Access Overload Class 2 XX*
(ACCOLC) 12 Station Class Mark (SCM) 4* XXXX 13 Local Use Mark (LU) 1 1 14
Min Mark (MIN) 1 1 15 Initial Paging Channel 3 333 or 334* (IPCH) 16
Preferred System Mark 1 0 or 1* (PS) * Notes- 1. Home Area ID Number
normally consists of five digits. However, four are usually sufficient is
the U.S. 2. Access Overload Class is generally made up of a "0" plus the
last digits of the telephone number. Some systems set at "15" or "00". 3.
Station Class Mark is expressed as four binary digits. 4. Initial Paging
Channel is 334 for wireline, 333 for non-wireline systems. 5. The Preferred
Mark System is set to "0" for wireline, "1" for non- wireline systems.

A Mobira Service Handset (Modified) may be used. It is made from an ME53 or ME57 handset by opening and adding a jumper to the left of the one factory installed just below the white 24 pin connector joining the top and bottom PCB's. Also, pins 1 and 14 of the handset connector must be jumpered at the radio end. To disassemble the handset, carefully pry off the plastic earpad retaining housing to expose on hexdrive screw. Two other screws are under the rubber plugs at either side of the microphone. The handset then splits apart. This is a ticklish job and isn't recommended except in an extreme case and not with the customer's handset. The modification does not affect normal operation of the handset. It is not known if a Radio handset will work the same. After the Service Handset has been applied: To enter LOCAL MODE (which takes the phone off the air and allows service commands to be obeyed) press 01#. The display should clear and noise is heard from the earpiece. To enter the NAM programming mode, enter 48#. The display shows 48 briefly and clears. ACTION KEYBOARD ENTRY DISPLAY 0 * (5-digit SID) 1 * 1 * XXXXXXXXXX * 10 * 334 * 07 * 0 * 10 * 12345 * Press * to exit NAM programming mode and return to Local Mode. To enter the NAM reading mode, press 49#. The display will show 49.

* PART VII. THE ELECTRONIC SERIAL NUMBER - AN INTRODUCTION When a cellular phone is removed from factory packaging, the ESN normally can be found in the document package (or on a sticker stuck to the phone). This ESN is usually correct and system registration procedes quickly. If the phone is used or has been turned off for non-payment of bills, the person who restores the service needs the ESN in order to program the system with an MIN. Every manufacturer assigns their own ESN, consequently it is possible to have a number of the same ESN's, although each may be produced by a seperate manufacturer. For example, there may be a Motorola ESN of 123456, an Audiovox ESN of 123456, etc. With this in mind it is a possibility that a person could broadcast without changing the ESN, but rather changing the SCM and the SIDH. The ESN is a 32-bit number which uniquely identifies each unit. This ESN is factory programmed and installed and cannot be changed in the field without removing it and reprogramming a new chip. The ESN may or may not be related to the serial number stamped on the outside of the transceiver chassis. The ESN is encoded into messages which are interchanged with the cellular tower. The ESN must be provided when the phone is registered for service. The ESN is an 11-digit number. THE FIRST THREE NUMBERS ARE THE MANUFACTURERS DECIMAL CODE, THE NEXT TWO ARE RESERVED (BUT MAY CONTAIN ZEROS OR NUMBERS) AND THE REMAINING SIX ARE THE DECIMAL SERIAL NUMBER.

****

* PART VIII. IDENTIFYING THE ESN IN YOUR CELLULAR PHONE Depending on what

model phone you have, the ESN will be located on a PROM. The PROM is programmed at the factory, and installed usually with the security fuse blown to prevent tampering. The code on the PROM might possibly be obtained by unsoldering it from the cellular phone, putting it in a PROM reader, and then obtaining a memory map of the chip. The PROM is going to have from sixteen to twenty-eight leads coming from it. It is a bipolar PROM. SEE ESN.GIF FOR ADDITIONAL INFORMATION. The majority of phones will accept the National Semiconductor 32x8 PROM, which will hold the ESN and cannot be reprogrammed. If the ESN is known on the phone, it is possible to trace the memory map by installing the PROM into a reader, and obtaining the fuse map from the PROM by triggering the "READ MASTER" switch of the PROM programmer. In addition, most PROM programming systems include a verify and compare switch to allow you to compare the programming of one PROM with another. As said earlier, the ESN is uniformly black with sixteen to twenty-eight leads emanating from it's rectangular body, or square shaped body. If it is the dual-in-line package chip, (usually found in transportables and installed phones),it is rectangular. If it is the plastic leaded chip carrier (PLCC), it will be square and have a much smaller appearance. Functionally, they are the same chip, but the PLCC is used with hand held cellular phones because of the need for reduced size circuitry. It will have a notch within, and also have writing in small white letters on it. (A black chip with small white letters? Should be easy to spot huh?). Look for the follow letters on the chip: MMI TI NS HARRIS NSC MB DM HM AMD TBP MOTOROLA AMPS Once you have found the chip, try ordering a new one (maybe a couple of new ones) from the businesses in the MERCHANDISE SECTION located at the end of this file.
****
* PART IX. SCANNING TO FIND THE ESN/MIN PAIR Well if you haven't guessed by now, the mobiles ESN and MIN must match in the switch or no go. This is required for billing purposes. If one had the ESN and the mobile phone number (MIN), he could call anytime and anyplace without fear of a trace - let alone a bill. The ideal setup would let you listen with a scanner to the reverse control channel, record and display heard working numbers and ESN's, and recall them as one needs to make calls. This would be it, but we are not quite there yet. But some of the hard work has already been done for us. All the aforementioned codes are sent in hex, in NRZ code (phase-key shifting), when a cellular subscriber places a call. But guess what? All phones have an NRZ receiver and transmitter built right into them. All that has to be done is to have a receiver on the reverse control channel, recover the other subscibers data and save it or print it out. Cellular phones operate on a full duplex channel. One frequency is used for transmission from the base to the phone, while another is used for transmission from the phone to the base. The base frequencies are always exactly 45 MHZ higher than the phone frequency, and both of these are incremented by 30 KHZ as the progression of channels increases from Channel #1 to Chanel #1023 (NOTE: There are no channels between 800 and 990). With some systems (not all) the cellular transmission is received by the base and retransmitted on the base frequency. When this is done, a scanner can listen to both sides of the conversation by simply monitoring the base frequency. When this is not the case, two scanners set 45 MHZ apart will work. Here is a list of all Cellular Frequencies: Non-Wireline Wireline Channel Tx Freq Rx Freq Channel

Tx Freq Rx Freq Number Mhz Mhz Number Mhz Mhz 1 870.03 825.03 334 880.02

893.94 848.94 1023 870.00 825.00 799 893.97 848.97 Here is a method of
determining which frequencies are used in a cellular system, and which ones
are in what cells. If the system uses OMNICELLS, as most do, you can readily
find all the channels in a cell if you know just one of them, using tables
constructed with the instructions below. Cellular frequencies are assigned
by channel number, and for all channel numbers, in both wireline and
non-wireline systems, the formula is: Transmit Frequency = (channel number x
.030 MHz) + 870 MHz Receive Frequency = (channel number x .030 Mhz) + 825
Mhz "Band A" (one of the two blocks) uses channels 1 - 333. To construct a
table showing frequency by cells, use channel 333 as the top left corner of
a table. The next entry to the right of channel 333 is 332, the next is 331,
etc., down to channel 313. Enter channel 312 underneath 333, 311 under 332,
etc. Each channel across the top row is the first channel in each CELL of
the system; each channel DOWN from the column from the the first channel is
the next frequency assigned to that cell. You may have noted that each
channel down is 21 channels lower in number. Usually the data channel used
is the highest numbered channel in a cell. "Band B" uses channels from 334
to 666. Construct your table in a similar way, with channel 334 in the upper
left corner, 335 the next entry to the right. The data channel should be the
lowest numbered channel in each cell this time. Cellular Phone Band A
(Channel 1 is Data) Cell #

We've all seen them, are they available for purchase anywhere?, and are they compatible with 'civilian' Scanners and Radios?

>Probably MilSat. MilSats are the only thing which use FM in that range,
> all comms from 225 - 400 MHz are AM except for MilSats. Plus you
>would't hear Marine comms near that freq.
>

George speaks out of ignorance, but at leats he's consistent. There are some specialized, multiplexed air/air & air/ground circuits in the 225-400 spectrum that use wideband FM. They've been around since the early 1960s, and are fairly well known to serious military monitors, of which George is not one.

The comms on 257.150 are thought to be a terrestrial circuit of some sort in the ~300MHz area, being picked up & rebroadcast incidentally by a satellite transponder. This sort of thing has been happening ever since the UHF SATCOM birds became operational, and there's not a whole lot that can be done other than using the anti-jam techniques some of the birds have to perform spot nulling.

Took me all of 10 seconds to find one. Try a search engine... You might actually find what you are looking for...

A search for "coiled earphone" revealed this, amongst hundreds of other similar pages...

Now broadcasting live, NASA and Combat Air Patrol UHF/VHF comms in
support of Shuttle Launch STS-107.

Callsigns ARROW ## will be US Airforce fighers flying CAP Cover over the
Kennedy Space Center, OAKGROVE will be NORAD. Other callsigns you hear
will be other aircraft in support of STS-107. At times you'll NASA ##,
this will most likey be the Shuttle Training Aircraft doing approaches
to the Shuttle runway (15/33) and doing weather checks.

Live comms thru launch time can be found at http://www.MilAirComms.com

You didn't post the whole thing. Where's the part that says it's
illegal just to listen? This could be refering to divulging what
you've heard.

Also, from the title, it seems to infer that the original content of
this post (which I haven't seen) says that a cell capable scanner is
illegal, which it isn't. Just possessing a scanner that can listen
there isn't illegal, but the actual monitoring or divulging of that
information might be, depending on what the law you posted above
refers to. it IS illegal for a manufacturer to sell a cell capable
scanner out of the box in the US, although scanners made before the
ban can still be sold (but you're only going to find them used
anyway).

This all is really moot though, since there are very few places left
in the US that you'd be able to find any analog cell phone usage.

Which means I was right, not ignorant. It was a bird picking up a
ground based signal, alot of which are picked up over Mexico and other
parts of South America.....

And who cares if you've been around since the early 60's, that really
added nothing to the conversation other to show your age...

I don't know but I've recieved a hell of a lot of good info from
George. You say you have been around since the 60's but I can't find
any good info you posted to the usenets.....At least George takes the
time to help the new commers to the hobby. That is something that
many 'serious military monitors' don't do. He has given me many
frequencies which turned out to be very good.

And your contributions to the hobby is what again tim?

The lack of a reply was not intended to be an instance of "rudeness". I do try to answer questions
about my software in a timely manner. However, I am in the middle of a large project at my "real"
job (the one for which I'm paid), and have a deadline looming. During this time, direct email
support of the programs I make available for free has to take a back seat to performing the job that
pays the bills. I do monitor the Yahoo lists for the PRO-92, 93, and 95, and try to answer questions
there that go unanswered by other list subscribers.

I think that if one looks back through these two newsgroups, and perhaps also checks the Yahoo
groups, one will find that I do try to respond to questions about my software and about the scanners
themselves. Given that, I disagree with the supposition that "rudeness is to be expected". I expect
that the vast majority of the users of my software will support my opinion.

That said, the answer is to the original query is: No, I do not plan to make the source code
available. Agreements that I have made with other parties, as well as information that I have

obtained, currently preclude such an action. I may release a version for Linux, but that certainly
will not happen in the near future, if it happens at all.

Don, first let me thank you for your efforts and a fine piece of software.

Disregard the idiots that think that, because you write a program, it entitles them to make any demands they deem is do them.

I have used about every operating system around since first starting in computers in the late 50's. I have to laugh when I see the Johnny come lately take pride in denouncing the mainstream operating system . Then they have the audacity to complain when the author of a nifty piece of freeware doesn't support them. How dare you have a real job when I have needs!

If those that decide that the _____ operating system is better than (Insert favorite derisive term for windows) , then they should write their own nifty application..

Those of us that recognize that you have tried to reach the greatest number of hobbyists salute you Sir! Keep up the great work.

OK, I'll redact "ignorant" & replace it with "stupid."

My contention was your assertion that the only FM uses in 225-400MHz is
military SATCOM was erroneous, and I gave an example of why.

>
>And who cares if you've been around since the early 60's, that really
>added nothing to the conversation other to show your age...

Yes, definitely stupid! I said the system (UHF multiplexed wideband FM) had
been around since the 1960s. You assumed that meant I'd been monitoring it
since the 1960s, and you're wrong about that, too.

Ditto,

I bought the first BC2500 batch and sent it back within 4 months because it drained the battery pack overnight.... turns out they had a "problem" with the first batch of units and repaired mine... also had another problem with very noisy audio that they repaired also.....

Then there was the AOR 1500 that picked up local TV chan 7 on just about every channel (above 800mhz) that was programmed in, turned out they had the 3rd IF frequency set for approx 180mhz........ another first batch bunch.....

I took a chance on the BC 245 "after" I watched the BC235 come out with no EDDACs ..... the only complaints I had were Uniden must have the market cornered on NiCd battery packs and their LCD can't be read unless the radio is tilted "back".....

Needless to say I got tired of waiting for they BC250D and went with a PRO95..... the display has adjustable contrast and the unit takes AA batteries..... it may not track the APCO25 systems but in all other aspects it meets the BC250D

.....and the speaker volumn and clarity is 100x superior to the BC250D..... UNIDEN wake up!!!!!!!... did I mention it only costs $150..... it's off sale now and goes for $250.....

enjoy

Source record: 38337

I have used this less than 20 minutes and it is indistinguishable from new. It is surplus to my needs because my VX-5R XCVR handles my scanning requirements.

It has been upgraded with the KN6GA heavy-duty belt clip, which costs $16.50 delivered. See:

http://www.dslextreme.com/users/rdashoff/VX-5r.htm

I still have the original clip.

Specs are at:
http://www.yaesu.com/amateur/pdf/brochures/vr_120.pdf

Although not mentioned by Yaesu, this scanner can be fully programmed with excellent freeware.

Original box and documentation.

$95 including shipping to CONUS

Is there a windows program out there that can make the same tones that are used to alert fire departments of a call? Usually, these are either a 2-Tone or a Long 8-second Tone. Its makes the pagers go off...

I'd like to be able to play it on my computer with a sound card to give demo's of a fire page, but without spending a fortune for a encoder.

Any ideas?

Thanks,
Dan

FS: - "Bob Grove's Scanner & Shortwave Answer Book" Where you can find answers to all your scanner & shortwave questions.152 pages. paperback. Has several photos in book. This is one VERY interesting book! Hard to put down once you start reading. Topics inc, Scanning & accessories, Antenna systems, Listening tips, Scanners, Who's Where (Freq) Both on Scanning & Shortwave Topics and Freq.'s. Much more! $10 (add $3 USPS)

FS: - "The Citizen's Guide To Scanning" by Bob Kay. 125 pgs Paperback. Ton's of Freq for scanner listening as well as explains Codes and Who is where on Freq. Band plan. Lots of photo's. Police, Nasa, Media, Govmt, exciting info for the average person to comprehend and understand. Very good Book! $5 (add $3 USPS)

FS: - "Communications Satellites" - "A Monitor's Guide" Popular 3rd Edition by Larry Van Horn. Larger 255 pg Paperback with literally TONS of photos and extremely interesting data and freq lists and How to's! This is one book I can not say enough about!! Published by Grove Enterprises (The Popular Bob Grove) How to tune in Satellites, Domestic, international, Space-Station, DBS, WX, etc, Monitoring tips, techniques, how to's, Ton's of info, freq's, Satellite info, on and on! A must have book for the listening enthusiast! Monitor the Space Station & Space shuttle missions! $10 (add $4 USPS)

FS: - "The Hidden Signals On Satellite TV" by Thomas P. Harrington. Popular 2nd Edition. Monitor STereo Subcarriers, Telephone channels,world news services, audio subcarriers, Teletype News-Press, Commodity News, Radio Channels, Stock Market Reports, Teletext (VBI), Single Channel Per Carrier, Multiplex Data Channels Plus Many Other "HIDDEN" Services On Satellite. 234 page Paperback. Convert your home Satellite Big dish into a Monitoring Station, Freq.'s, Photo's, and how to's. Hook up a Police scanner to a Big Dish Satellite system and listen to an unbelievable amount of stuff all contained within this interesting book! $10 (add $4 USPS)

FS: - "Betty Bearcat" Frequency Directory for SouthEast Region of USA (AL, AK, FL, GA, LO ,MS, NC, SC, TN, Puerto Rico & Virgin Is.) over 1" thick book full of scanner freq.'s for Police/fire/Ambulance/Govrmnt/Transport/ and many more! Some photos, Freq. Band plans, 10 Codes, much more! Also w/ purchase of this Book will throw-in another Book for FREE. "Police Call" - "Radio Guide" by Radio Shack. Includes Fire/ER services. Freq list for FL, NC, GA, VA, DC, SC, WV. Volume 6. $5 (for both books) (add $5 USPS)

FS: - "COSMOS" by Carl Sagan. A #1 Best-Seller Book. 5 Million copies in print! Never look at the stars or the wonders of space the same again! This exciting book traces today's knowledge and scientific methods to their historical roots. Past, present and future of the Cosmos, Galaxies and future of science. A real quality 325 page paperback book any astronomer will love! $5 (add $3 USPS)

If purchasing more than one book, shipping will be much less.

>Hardly seems worth buying a used one at that price

Bruce, then you shouldn't buy it. And you should look again.

The 120D is $124 at Gigaparts and $130 at Universal. Add $16 for the good clip and you are up to $150 with shipping. That's vs. $95 for a like-new.

OTOH, if you want the new rechargeable feature and want to spring yet an additional $30 (getting you to $180) for the options you need to make it work, then new is your choice. Clearly the same price as what I am asking.

765. No more scanner use at F1 races.

Newsgroup: rec.radio.scanner
Date: 2003-01-17 02:51:45 UTC
From: "Michael G. Koerner" <mgk920@dataex.com>
Message-ID: <3E276FBF.3661FAD3@dataex.com>
Source record: 38398

In an attempt to cut the extreme costs of racing in the Formula 1
circuit, the F1 bosses have decreed that ALL electronic communication
between a car/driver and the pit crew will be *prohibited* starting with
the upcoming 2003 season. This includes all telemetry data and two-way
voice radio. The change is specifically a 'to the letter' enforcement
of an existing rule stating that "The driver must drive cars alone and unaided".

You can certainly bring a radio scanner to the races (North American
stops are scheduled at Indianapolis and Montreal), but there won't be
anything to hear from the competitors, except maybe between spotters and
pit crews.

See:
http://www.f1i.com/articles/ARTICLE_482517.html
for more details.

This should make for some VERY INTERESTING racing, indeed!

Could you then play this sound over the air and trip FD pagers across
town? If you're really just "playing" sounds on a PC (not that I
understand the reasoning or purpose for this), then any sound will do.

I reviewed an Alinco DJ-X2000T in June 2001
Monitoring Times magazine but don't own one.

Yes, the Flash Tune lets you hear the audio once
it finds a signal, but you must set the mode
before starting the Flash Tune operation.

However, it is a slower process when compared with
an "instant" frequency counter. You couldn't
easily use it to follow both sides of a conversation
on two disparate frequencies.

What is the major diffs in the pro-93 and pro-92? The 92 is only $20 more here in Ny where I live, and gives you
200 more channels. thanks and God bless. I now own the pro-93 and will exchange it
for the pro-92 if it is a better radio (ie more features not found in pro 93)

Also, will the pro-92 track things the pro-93 will not, or are they basically the same scanner? Thanks

93 is better - it has text Labels so you can tell what you are listing to.
Otherwize you are looking at random numbers on your screen.
You have more freq coverage in 93.

You don't need alll those channels - you get all trunking channels in one 93
channel

But you might want the pro95..

if you insist on creating actual specific tones figure out the frequencies of the tones and use CoolEdit (an audio editing program) to create them as it can creat tones i have used it in the past to generate many different tones

This unit will grab cellular's ESN, phone number, dialed number, SSID, etc.
off the air. This unit is in good working condition.

Can log data, etc. Portable, will work on some PCS systems. - It is a self
contained unit. A printer can be hooked up to it as well. Have a pic for
serious buyers.

Not responsible with what you do with it..

Asking $400 or best offer.
C2it.com, Bidpay, or Paypal, MO, checks only.

From: "Bob Parnass, AJ9S" <not_for_mail@fake789.com>
Message-ID: <pan.2003.01.17.14.12.38.878842@fake789.com>
Source record: 38407
Cross-posted to: alt.radio.scanner,sci.electronics.repair,rec.radio.scanner

Is there a pattern to which frequencies
won't open the squelch? Does the problem
always occur on the same frequencies?

I don't have a BC140 schematic. Some Bearcat
scanners employ a "window detector" circuit
which prevents the scanner from stopping on signals
if they are a few kHz off frequency. (The window
detector consists of a pair of operational amplifiers
configured as a "difference amp" which monitors the
discriminator current and generates a logic level
"go/no go" signal.)

I wonder if your BC140's reference oscillator
has wandered off frequency, which means the radio
would be listening off frequency.

The higher the frequency, the more pronounced the error.
Then, the radio would skip signals you would expect it to hear.

Another possibility is that your scanner is experiencing
interference from another transmitter.

780. Neighbor Eavesdropping/Interfering With Cordless Phone

Newsgroup: rec.radio.scanner
Date: 2003-01-17 17:29:16 UTC
From: john.l.simion@usace.army.mil
Message-ID: <a6797d92.0301170929.12d2ac0f@posting.google.com>
Source record: 38412

Our neighbors have an ongoing war with us for reasons that don't even make sense and aren't relevant here. Lately we have been having problems with our cordless phones. When we talk on the phone, we sometimes get loud clicking sounds that interfere with the conversation. The clicks are irregular and sound like someone keying in on a walkie-talkie but not saying anything. Last night, I was speaking to my father and the clicking began. When I mentioned that I wondered if my neighbor was somehow interfering with our phones and what a low-life I thought he was, the clicking suddenly increased in speed and volume to the point I had to hang up and call on a corded phone, after which I had no further problems. This tends to confirm my suspicions that the neighbors are behind the problem.

I've been told my neighbor has a scanner. I understand anyone can listen in on cordless phones using a scanner, but I don't understand how he could make the clicking sounds. Could you use the scanner to make the clicking sounds? I see no antenna for a ham radio. Could some other type of 900 mHz device, like a baby monitor, be tuned in so it would interfere with our phones? We are both on a "zero lot line" lot, which means the houses are only about 12' apart, so it wouldn't take much transmission power. If they are so bored that they want to listen to our conversations, I guess there is nothing I can do but switch to corded phones. However, interfering with my calls is really annoying. Is there any way to fight back?

Anyone have any ideas?

Is your phone a 900 Mhz unit? Is it analog or digital? Scanners cannot transmit. Baby monitors typically can only cover 2 or 3 channels. There are 2 types. One on the old 49 Mhz band and one type on the new 900 Mhz analog band.

If your phone has a button that allows a channel change, try that. if he has a baby monitior, your phone can go to channels he cannot. It is possible your phone is interfering with their monitor, and he is getting revenge. While not really your fault, some people just really do not understand.

Failing thatr, my suggestion is to replace your phone with a 900 Mhz digital, or preferrably a Digital spread spectrum unit. Both are relatively inexpensive now.

I have a Pro-89 RadioShack race scanner (Cat No. 20-514),
and a Data-Loading Software and Cable by RadioShack (Cat No. 20-048).

I followed the instructions from the manual, and I cannot upload anything.
Does anyone have experience doing this?

After I entered the data in the software, and Turned On the scanner on
'Wired' mode, I pressed 'Upload' .... but nothing happens..... 20 seconds
later the scanner exits 'Wired' mode and there is nothing stored on it.

I appreciate your comments.
Antonio M.

All of the advice in the above posts is sound and will most likely prevent your neighbor from listening to your calls. Now, as to "fighting back"......you can find out if they are listening by making (and recording) some "phoney" calls that might affect him and watch his reaction. If you use a little imagination this can be great fun ! :)

Please quote the law prohibiting somone from monitoring unencrypted packet radio data using a freeware program.

In order to run afoul of the law one must break it first. Bending it doesn't count.

I love how people in this group act so paranoid about imaginary and/or unenforceable laws, yet break other more widely enforced laws (such as exceeding posted speed limits and running red lights) regularly and think nothing of it.

Tell me what you think: Would it be possible to buy the APCO card for the 250 and hack it to work in say, a 780 or 895?

All the apco decoding is done on the card, AFAIK. It likely uses a discriminator tap for input, processes the signal, converts it to voice and then passes it down to the audio circuitry.

So, I would think with the correct pins to connected to the correct spots on the scanner's mainboard, it should work! You wouldn't be able to adjust the audio fine tuning like you can on a 250 but WHO CARES?!

Of course that's alot of money to spend on something you might inadvertantly blow up..... but anyone with decent electronics experience could probably decipher what pins do what with a fairly reasonable chance of accuracy....

Anyone have any thoughts on this? Better yet, anyone willing to try it? I don't dare. I'm all thumbs with a soldering iron - I'd probably just wreck the thing. But there are others here who could pull it off... heck I'd ship my scanner off to someone and pay an additional fee for that person/company to install it for me and I'm sure others would too!

The 92/2067 is pretty easy. No encryption on the data, though the parity is switched around during
the transfer. Here's what you should be doing:
1. Serial port set to 4800, even parity, 8 data, 2 stop
2. Write a bunch of xA5 chars. The scanner sends 50 when it dumps, but more doesn't hurt. My
software sends 100.
3. Write the "signature" string: 4 bytes: x01 x98 x03 x52
4. Wait 52 milliseconds
5. Switch port to odd parity
6. Write 26,496 bytes of data as 32-byte blocks, with 16 milliseconds of "dead" time after each
block (this is to give the scanner time to program its EEPROM).
7. Switch the port back to even parity.
8. Write the terminating x5A byte.

Note the following:
1. An SPG file has 5 bytes at the beginning (x02 x00 x00 x00 x00) that are not written to the
scanner.
2. The next 26,496 bytes of data are written to the scanner in REVERSE order.
3. The SPG file has extra "padding" such that its size is 32,773 bytes (32KB + the 5 bytes in #1
above).

My software only uses the "SPG" file convention because some other software had already established
it as the "standard" for the PRO-92/2067.

Any questions on the 92/2067 protocol, feel free to ask. I just can't answer questions about the
93/2053/95.

-Don

And, if they still allowed the use of comms, and a tragic accident occurred, the same lawsuits would be filed alleging the "distraction" of the comm equipment was the cause of the accident(s). And the same bunch of 'deep pockets' would be sued. The solution is to, as Bill Shakespeare once said, "kill all the lawyers!". There are no good/bad ideas, there are only obnoxious ambulance chasers.

Anyone know a good online dealer of electronic components? I was ready to order from rat shack, but after seeing their prices and selection, I think not. Mouser electronics seemed good too, but for some parts I needed the minimum order was 4000! If anybody knows a good reliable source, i'm all ears.

Thanks in advance,
Matt

Or Digikey. Also good service (I've been impressed by their delivery times), good prices, and the
only places I see minimums (i.e. 10 or more pieces) is if you want a price discount.

Is your phone digital? Better yet, digital spread spectrum? Your neighbor shouldn't be able to monitor you if this is the case. However, for much increased security, get a newer phone on 2.4 GHz or, I believe, even on 5.8 GHz. Most unlikely he could here you on that band.

Ed

Maybe, he's running a "Big Boot" on his CB Radio, that could cause
intereference as well.

He doesn't need a good antenna or anything to interfere. Sometimes, they
just do.

I guess I should have clearified something, MilSats are teh only thing
which use FM in that range here in the United States at this time.

However there are other countries such as in South America which have
Cordless phones and a few other services which use FM. Its possible you
were hearing a Cordless phone call in South America which was being
pickedup by the bird (satellite) and re-transmitted on the birds down
link freq. I have heard of this happening from time to time. But
again in the US Milsats are the only thing which you are going to
receive in FM from 225-400MHz in the 1990's and year 2000 and beyond. I
don't know (nor care) what was using them in the 1960's.....

> insignificant compared to the automotive costs that it wouldn't be a
> drop in the bucket.

The problem wasn't necessarily with voice comm, but mainly with
telemetry data. The dominating Ferarri team (and most of the other
teams, for that matter) had a BUNCH of high-priced engineers monitoring
and adjusting EVERY minutia of their cars' performance in real time in
the pits, and the costs involved caused two teams to fold in 2002,
leaving ten left. Several teams spent well over 100 million dollars
each to try to be competitive with Ferarri last season.

Also, I suspect that eliminating 'voice' will cut back on the ability of
a team owner to tell a driver to hold back late in a race to let a
teammate win (some races in 2002 ended with such controversies).

The F1 bosses are trying to make their circuit less expensive and more
competitive. Expect more similarly radical changes over the next few
seasons (less expensive construction materials, more durable engines,
more standardized parts, etc).

Yes, the 100 channel BC278CLT is a better scanner than the
50 channel BC248CLT.

The former covers the commercial air band, while the latter does not.

The BC278CLT has both limit and service searches.
The BC248CLT has neither. Limit search is important for
finding new signals.

I reviewed the BC278CLT in Nov. 1999 Monitoring Times magazine
and the BC248CLT in the Dec. 1999 issue.

Another thing is that the pro92 has the extra pivot point mount.
If you're looking for a good radio try the pro93 or else better yet get the
92 as it has a dual tracking - truncated whip antenna. Mine is soaked in
urine for better reception.

I've been doing some experimenting with my live audio broadcasting. I recently got an AudioMixer and so far have set it up so I can mix the outputs of 4 scanners (more coming when I get more audio cables) into my computer.

I'm hoping with this setup I can broadcast more of the Daytona 500 Driver Audio and/or be able to switch between leaders frequencies quicker. It should also allow me to switch to the scanner with the most interesting audio much quicker (like when a driver is swearing at another driver over the radio..).

However I do have a question not regarding the Daytona 500. Which do the majority of listeners find more interesting as far as to day listening?

a) Police-Fire
b) Air as in Daytona International Airport AirTraffic Control
c) MilAir activity (here in Florida if I mix about 5 scanners audio there should be a comm almost all the time).

Looking for input....

Its very possible it could have been somewhere in Africa. I'm not sure where you're located but there is a MilSat which has a large footprint that covers both the East Coast of the US/South America and the WestCoast of Africa. The MilSats have pretty large footprints to allow them to cover a very wide range.

I've heard many reports of phone calls in South America being picked up by the orbiting birds so that was my first guess.

Hello everyone,

I am relatively new to scanning. I hope everyone here will pardon me for some silly questions.
I noticed that under some frequencies, I will hear weird sounds, for example like faxing sounds, or like connecting to the internet using a dialup modem.
Can anyone tell me what actually are those sounds?
Also why are there so many frequencies which have silent transmissions?
Thanks in advance.

Lionel

Instead of clarifying things for others, do some research and gain some clarity yourself. You're pretty ignorant about military comms, George, but because you've bought yourself a 'MilAirComms' domain, unfortunately, some people assume you know what you're talking about. Your fan Frank believes in you, because he thinks you have a lot of radios...

"MilSats" are not the only thing which use FM in the 225-400MHz range in the USA.

Should you ever chose to educate yourself, instead of skipping that step and going directly to trying to educate others, you might come across a plethora of information regarding a pretty extensive US military network which uses high-power, air/air & air/ground (but not "MilSat") WBFM multiplexed system, as well as a variety of air/air & air/ground data links using FM in the 225-400MHz spectrum inside & outside the USA, and this stuff has been easily heard & reported by monitors for decades.

For years I have used a Ricochet SS 900 MHz modem and it would interfere with my Tropez Digital SS 900 MHz cordless phone. You would hear rapid clicks as the modem hops to 163 channels between 902 & 928. Now if you are using a analog 900 MHz phone, you would get even more interference. The Ricochet modem runs 1 Watt so it can really get annoying when the user was surfing the net. The Ricochet system is down except for San Diego & Denver but many of the modems are out there. I bought one for $2.00 at flea market. If you use a analog cordless phone, you are broadcasting in the clear for several blocks. My scanner picks them up att the time.

Hi George:

I was just at your webpage today! I visit frequentlly...always enjoy myself.

Anyway, I'd vote for more Military coms.

P.S. I have a Alinco full coverage scanner and I can never, ever pick up the military. I'm in Toronto, Canada and other listeners near me report lots to hear. Any tips? I understand Milcoms are AM, but I get nothing. Is step size crucial?

All the best
Mike T.

Not necessarily true. There are many devices that use 2.4, and 5.8GHz bands. Other phones, 802.11A, B, and G Wi-Fi wireless networking, wireless stereo, and TV, and cameras. Oh yea, microwave ovens are in the 2.4GHz band!

What type of antenna are you using, that might be the key. You are correct, you'll want to be in AM mode.

You might want to search for the MilAir freqs for the Toronto Airport, that might be a good starting point unless you've found some other lists of freqs near you.

Step size would be set to 25 KHz.

George

From: Matt <jokermatt@ameritech.net>
Message-ID: <oljW9.628$4y6.437934@newssrv26.news.prodigy.com>
Source record: 38380

> I am relatively new to scanning. I hope everyone here will pardon me for
> some silly questions.

The only silly question is one not asked

> I noticed that under some frequencies, I will hear weird sounds, for
example
> like faxing sounds, or like connecting to the internet using a dialup
modem.
> Can anyone tell me what actually are those sounds?

These are sounds of data being transmitted.

> Also why are there so many frequencies which have silent transmissions?

There are a few reasons:
1.The frequency is not being used.
2.The frequency is a backup.
3.The frequency is out of your range.

853. ARC780 problem

Newsgroup: rec.radio.scanner
Date: 2003-01-18 21:24:40 UTC
From: John <PowersJohn@iname.com>
Message-ID: <Xns9307A612DF4C1IName@63.209.170.235>
Source record: 38386

I am trying to get ARC780 from Butel to work. I have tried installing it on 2 different computers and get the same error on both. Whenever I try to run it it reports "Invalid DLL: WRTHF.DLL". I can't find any such file on either computer so I don't know what is causing this error.

I have written Butel twice but have never received any response. I also downloaded the files 3 times and get the same results.

Does anyone have any ideas or experience with a similar fault? I am running Windows XP Professional.

John

854. Where can I, or can I not take a scanner in Illinois?

Newsgroup: rec.radio.scanner

Thanks George:

I'll check my step size first. I do get Toronto airport coms just fine so I'm sure it's my antenna. I have a 36" external antenna, but it's not mounted very high - 15 feet. Since I live in a 'flat', I have no way to get it any higher.

Anyway, thanks for the tips.
All the best
Mike

There are no laws against possession or use of a scanner in Illinois.

The closest thing there is in the City of Chicago banned the use of a
scanner during the commission of a crime a few years back, so don't
commit a crime and you are safe.

This could have been a lot worse: There were laws proposed in Chicago
and by the State legislature within months of each other about 5 years
ago to ban or restrict the use of scanners in the City and State. Both
proposals were withdrawn after vigorous work by CARMA and SABRE members
and we are safe (for now).

a clicking sound can easily be made by pushing the "hang up" button on the phone very quickly and releasing it very quickly. If you do it quicly enough, it won't hang up.

You might want to try one of these:
http://users.cis.net/kingpop/Scantenna.htm I have one mounted at about
18' and its does a VERY good job! I actually find myself using that
antenna more than a $300.00 Log Periodic that I have. It will be a
suprising difference over yoru 36" external.

Thanks guys!

I'll check these out for sure. (Freqs and antennas)

Very much appreciated!!
Mike T.

863. Railspotters Encounter Suspicion

Newsgroup: rec.radio.scanner

Railspotters Encounter Suspicion
Thousands, perhaps millions, of people around the world love trains and spend much of their time observing and photographing railroad operations. In general, railroads have encouraged these "railfans" as long as they do not trespass or interfere with operations. Railroads even hold contests to use railfan photographs in calendars, and the Association of American Railroads has a Web site to encourage the hobby.

But after the FBI announced it had credible reports that al Qaeda might be targeting railroads, a growing minority of railfans have been questioned and sometimes searched. A handful have even been threatened with arrest.

Law enforcement officers and train crews have been told to be on the lookout for suspicious characters asking detailed questions about railroad operations, taking notes and taking pictures of trains. It appears the descriptions of "terrorist" and "railfan" are the same.

"We certainly aren't out to destroy an American tradition of watching trains, but we have to be careful," said John Bromley, head of public relations for Union Pacific. Normally, police who encounter railfans simply check identities and record names and other basic information. But a few encounters go beyond that.

Even as police and the railroads view railfans with suspicion, Federal Railroad Administrator Alan Rutter says the railfan network could be "a real value" in spotting truly suspicious activity. Rutter said the government is already taking advantage of the intelligence-gathering abilities of railfans, which is substantial.

Meanwhile, railfan chat sites have been filled with advice on what to do about the growing police attention. That advice includes a caution that the railroads also stress: Don't trespass on railroad property. The advice also includes ways to look unthreatening, by wearing a shirt with a locomotive on it, for instance, or carrying railfan magazines to show police officers who never heard of the hobby.

"As crazy as it sounds, you need to educate the cop about our strange hobby in under 60 seconds," wrote Todd Clark, the webmaster of Trainorders.com. That advice should ring familiar to a lot of scanner and utility radio hobbyists!

> is it just 2 meter and 70 cm
> bands commonley used?

2 meters is by far the most-used VHF ham band. 70 cm (420-450 MHz, UHF) is used less (at least that is the case around here) but we do have quite a few repeaters there too.

> who might utilize 10 meter and25 cm/and or33cm bands

10 meters is a HF band and can be utilized by hams of the following license classes: Novice, Technicians with Code certification, General, Advanced and Extra. Yaesu is making a portable radio that can transmit on 10 meters as well (the FT 8900). There are 10 meter repeaters, and DX (distant-station listening) to be found on 10 meters as well.

The 33 cm band is used less than 70 cm around here; some hams are into experimentation on these and the higher frequencies (the microwave bands). Much of the equipment used here is homebrewed, as there is not a whole lot that is commercially available yet.

If you want to monitor ham activity, 2 meters is your best bet.

10 meter band is mainly skywave USB, so you must have a SSB cable monitor
or something with a BFO (Beat Frequency Ocillator).

The 20 meter band is also pretty active along with the 17 meter band
for LSB skywave.

40 meter and 75 meter bands are mainly more regional and are generally
ground wave with some skywave.

It is just 6 meter and above (generally) that you will find FM transmissions
on amateur radio allocated bands, this includes 6 meter (50-54 Mhz.),
2 meter (144-148 Mhz.), 1.25 meter (222-225 Mhz.) which is underutilized,
70 centimeter band (430-450 Mhz in the U.S.) and on rare occasion some FM
on 900 Mhz (902-928) and 1240 Mhz (1240-1300 Mhz.).

You might want to update the "USAF HIGH FREQUENCY GLOBAL COMMUNICATIONS
SYSTEM "HF-GCS" to refelect the current status.

In addition to the name change you could correct the frequencies.
Frequencies are 4724, 6712, 6739, 8992, 11175, 13200 and 15016.
You could also maybe add Keflavik.

This data has been widely publicised, but since you want others to
'contribute' I thought I would save you the trouble.

Dave

I don't understand. Who are you trying to "teach" communications to?
How about teaching me? Why do you need the actual freqs for teaching
purposes? Why don't you just play "Mary had a little lamb"? How about
asking your local FD for help... Or is that too much to ask. -Papa Rick

Yes.

> Can I take it to a County Fair? Bookstore?

Yes. Yes.

But, don't take a scanner inside a gambling casino.

I have the optional card for the AOR scanners for auction which allows you to decode CTCSS tones (also known as Private Line or PL). This is very useful if you are in an area where there are many co-channel users and you want to block out all the other agencies using the frequency except the one you want to hear. It allows you to monitor without losing your sanity.

Good lord, it is not a gun! Have you ever been arrested for a radio? If you could arrest folks for carrying radios, certain parts of town would be devoid of people.

876. first scanner, make it a wideband?

Newsgroup: rec.radio.scanner
Date: 2003-01-19 07:17:45 UTC
From: Dan Jacobson <jidanni@dman.ddts.net>
Message-ID: <87iswl7gme.fsf@jidanni.org>
Source record: 38259
Cross-posted to: rec.radio.scanner,comp.os.linux.hardware,gmane.comp.gnu.radio.general

To occupy my hours when the computer is turned off, it is time I
bought myself an "all frequencies" receiver (scanner).

I shall listen to the planes, trains, cop cars, etc. and the
walkie-talkied wild boar hunters that get too close to my property,
dang nab it. indeed everything from 1 to 1000 mhz and more will be in
my grasp. [whats this about 'cellular blocked'? yuck.]

I will spend less than US$150 perhaps. What should I buy? P.S. Later
perhaps i will hook it up to my GNU/Linux{tm} computer and do even
more things... is the Icom brand linux-friendly? I seem to see them
when I use use 'aptitude' to browse the debian software packages
cache.

877. What is Best Scanner for L.A.?

Newsgroup: rec.radio.scanner
Date: 2003-01-19 08:20:33 UTC
From: aidehua@aol.com
Message-ID: <20030119032033.05145.00000068@mb-cb.aol.com>

I live in Torrance, CA and would like to buy the most ideal scanner. My interest is to monitor LAPD, LA Fire, Torrance PD and LA Sheriff.

Are any of these using 9600, or will the 785 w/ digital card suffice? Your help is appreciated.

Thanks,
Ed NI6S

Hi Ed,

None of those agencies is using trunking, so the 9600-baud thing isn't an issue in LA County. Glendale (except their Fire Dept) will be going to a UHF trunked system within a few months, and I believe Culver City might be as well.

LAFD fought for and got a waiver from the FCC, so their 24-channel 800-band system is conventional, not trunked. It's analog for now, as well. LAPD is digital on UHF (484 & 506/507 Mhz bands), but they've specifically decided AGAINST using trunking. The new Unidens work just fine for them. Both LA County Sheriff & Fire Departments are UHF analog, no trunking. I believe Torrance is UHF analog for police & fire.

South Bay (Gardena, Hawthorne & Manhattan Beach) are all UHF analog.

You might want to take a peek at a couple pages I've put together...

Been hearing lots of chirping and low pitched beeps on this freq in the early morning. I'm hearing it in the Louisville, KY area. Is this freq used for some kind of RTTY or something? Is it a MilSat freq?

I'm looking for a bit of help. I have a friend here in Daytona Beach who wants to receive MilAir however he doesn't want to put an antenna outside.

His attic isn't tall enough to put a ScanTenna however if the longest element were cut it would fit fine.

My question is this, has anyone tried cutting the longest element in an effort to improve MilAir? By using the Length = 468/Freq I was thinking of cutting the center to 1.5' which would be a halfwave dipole for 312.5 MHz (center of the MilAir band).

Just looking for some input on this subject. I have a ScanTenna as part of my antenna collection and it does an excellent job for MilAir, my friends attic would put his ScanTenna at about the same height above the ground as mine.

Yes, I now realised that too. I think he provided me with a ton-o-freqs to help me determine if I could properly receive Toronto airport. (Actually called Pearson Intl.) Anyway, thanks to everyone. I have several things I need to try before I give up. (My money is on my poor antenna...we'll see)

BTW, I do get the Pearson Intl. Airport trunked just fine. Excellent ops / ground listening.

Thanks again
Mike T.

I will soon be travelling to New Zealand.
I have two questions:

1. Any problem bringing in a Pro43?

2. Is there a good source for frequencies in and around
Auckland, the North Island and the northern tip of
the South Island. Also ferry service frequencies.

(remove "pants" to reply by email)

I think you can decode the data channel with some software but I can't remember the name off-hand. I'm not sure if you could decode it with a non trunking reciever but I think you could, you just would't be able to use it to listen to the trs.

Why? '93 works fine on conventional, unless you need CTCSS. If you need CTCSS or LTR, then go with the '92.

Yes.

Look at www.trunkedradio.net and look for the programs Trunker and
ETrunk. You do not need a trunktracking scanner, but you need a
receiver with a "discriminator output", and you need a "data slicer".
These are all explained in various articles on the website.

When I scan in the 900 mhz area I get something like feedback at different freqs, usually around 900 to 910. Like I said it is like feedback but at different freqs for like a couple of seconds then stops and the scan continues. Sometimes for a few seconds sometimes for a few minutes before it happens again. Anyone have any ideas about this?

When I scan the lower freqs to try and listen to the fast food restaurants nearby I sometimes pickup conversation on someone's cordless phone. But it keeps cutting in and out like a bad connection. I tried adjusting the frequency up and down but can't get it to clear up. Any ideas why?

Thanks for any help on these questions.

Have a Drake SW2 in excellent condition, new remote, Drake PS, manual, Drake MS-8 speaker in excellent condition. Works great! $425 shipped CONUS only.

Also have anther Drake SW2 w/Kiwa mod, remote, Drake PS, manual, has encoder problem, $295 shipped CONUS only.

Will consider trading for LIKE NEW Icom R75 with or without Kiwa mods. Also have to possibly trade a RS Pro95 scanner with programming cable, three months old. Would ship the Pro95 and cable for $175 CONUS only.

Satisfaction guaranteed. Have references.

For big enthusiasts, its not what they hear but only the fact that they CAN hear it. In other words, they don't care all that much about listening, they just are proud of themselves for being able to listen.

Sure! groups.google.com! See below:

This may be old news to some, but upon asking around, I got no answers so I figured once I got around to doing it I'd share my results with the group.

BUT FIRST A WORD OF CAUTION: It never fails that someone will stumble across even the simplest of modifications and somehow manage to toast their scanner. I am hereby stating that if you read this post and decide to tinker with that unit this will be YOUR problem, not mine. If you break it, too bad. Not my fault, I didn't hold a soldering gun to your head, now did I? I am NOT responsible if you kill your scanner, OK? OK, on with it then...

NITTY GRITTY DETAILS: For those of you who know what your are doing and just want to know which pin and chip, it's MC3361CN, Pin #9. Have fun. For those who need more detailed instructions, read on below...

DISASSEMBLY of the PRO 91: Uniden does not want you to do this.(Yes this is a UNIDEN scanner.) This is evident in just how difficult the scanner is to take apart. You will need a small philip's head screwdriver AND a butter knife or similar implement to pull it off.

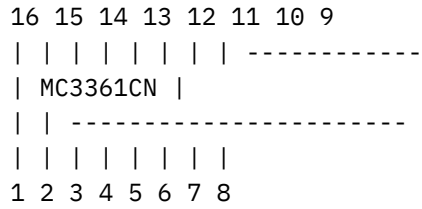
I don't think I have to tell you to unplug it first...but I will anyhow. Unplug it from the wall. Remove the battery cover and the batteries. It's also helpful to remove the antenna, just because it can get in the way during disassembly. Then remove the 4 screws that hold it together. You don't need to remove the belt clip, but I did just to keep it out of my way.

Now, using the butter knife, carefully run it along the edges of the scanner so that you can see a slight gap in the seam. Then use it to CAREFULLY pop the battery compartment area free of it's retaining flanges at the bottom. You'll see what I mean...

After about 5 minutes of fiddling with the knife, you'll get it free. Notice the large metal cover over the back half. Like I said, Uniden didn't want anyone tampering around in here. It's tempting to remove it, but don't bother trying - I did and found out that you can't - it's EPOXIED on! Fortunately, we don't have to mess with it.

Unplug the back board from the front one - it'll happen automatically when you pull it apart - just be mindful of the plug and don't bend those pins. The plug is located on the side opposite the power jack. Turn the board over and you will see the chip we'll be working on - MC3361CN. It's towards the bottom, right near where the speaker wires plug in. Can't miss it. I didn't bother to unplug the speaker, but you can if you want.

SOLDERING THE TAP IN PLACE:
The pin we want to tap is pin 9, per Bill Cheek's scandata.faq file. I confirmed it for myself last night - it works. Thanks Bill! For those who have no idea which pin is pin 9, see the diagram below:(use a fixed width font to view)



Pin 9 will be in the upper right hand corner. I simply took apart an old mono earphone I had and connected the + lead of it to this point. The decode rate I am getting is OK, but nothing to write home about. I'm going to put a 1.0 uf capacitor inline to see if that improves things, and I am suggesting here that you do the same. So, on pin 9, solder the + leg of a 1.0 tantalum capacitor to it, and then solder the tap wire to the other leg. Then pick a ground point (the metal plate that the antenna jack runs thru is a good spot) and connect the other lead to it.

I then just ran the wires down and out where the batteries go, and let the plug dangle out thru the battery compartment. You will find it closes just fine with this cable in the way. However, those going for a more "pro" look will probably want to get a 1/8 mini plug jack and mount that in the case somewhere. Have fun - I'm too lazy for that. ;-) Plus, if the scanner ever quits for any reason, it's a simple matter to remove the tap wire prior to shipping it off for service. Sure it's ugly, but it works right?

REASSEMBLY: Other than being careful not to bend the pins on the main board as you plug it into the socket on the other board, reassembly is fairly simple. Press the two halves together gently until you hear it "snap" into place. Then put the screws, antenna, belt clip and batteries back in and plug it into your favorite decoder or PC sound card - whichever method you use for data scanning. You're done!

LEGAL NONSENSE: Some people would get upset if their modification text appeared on someone's web page, in a book, on TV, etc. I'm not one of those people. I could care less who you give/sell/trade this info to or for what. More power to you. Don't get mad though if I spoil your party by telling everyone where they can get this info and more for free: Dejanews.com. If you would like to include it on a web page (I can't imagine why, but hey it's YOUR page...) you have my permission if you'd just be so kind as to mention who wrote it. If you don't, you can still have it, I won't come after you or anything, but it would just be a nice gesture. Thanks.

Hope that was helpful - I'm sure someone out there has a pro 91 and wants to do some data decoding with it! It works pretty good for that. Much easier than carrying a bulky 895 around!

Have fun...

I often wondered about that when compiling a new frequency list for our area (Vancouver BC). The frequencies are listed by store and location. The other aspect to fast food restaurants is that they've progammed their robotic order takers into accepting the menu selections by number so much now, there wouldn't be much detail to hear. (I've tripped many of them up by ordering exactly what I want at a McDonald's and Wendy's restaurant, rather than the package deal by number - have to watch those fries and Wendy's has alot of goodies to offer). Besides how many times have you gone up to the order board and say "cheesburger" and you hear "chizbg". The audio on those boards is many times craptacular if the thing works at all. I ordered a McChicken Meal once and got a Big Mac instead. Went for a Double Cheeseburger and got a McChicken meal once. Even speaking clearly evenly and distinctly using a clear and concise radio voice doesn't help much most of the time.

Aviation operations, fire and railway as well as marine would be more interesting than hearing someone who doesn't speak English very well say to acknowledge your order: "Machiz-sprszz-fiffiffirnixwiddeplizz" (McChicken-Supersize five fifty four at the next window, please)

Saw a sign once at a local pub-restaurant. It said "Ron and Wendy Eat here".

UPDATE!

Did some research and found the following:
The Discriminator output from a scanner is the raw, unfiltered signal that a scanner produces before it is sent to the audio stage
for output through the speaker -- also called the "baseband audio."

(apparently some software programs require this output to decode information the scanner is receiving)

you can click on the link below to see exactly where I found the info:
http://www.trunkedradio.net/digital/interface.htm

When I turn on my Aor8000 it comes up with Pll error and no noise comes out.
Its been working fine for years but now this has happened.
I have tried removing the batterys for a few minutes then putting them back in
but that has made no difference.
Does any1 know how i can fix this error?
Thanks

You bring up a great (but always controversial) name in our hobby. Bill Cheeks was a pioneer who was able to hack almost every scanner in existence. Bill died a few years ago due to cancer.

If you would truly like to "Thank" Bill for his work, I beleive his wife Cindy has set up a fund to help pay the remaining medical bills which are hanging over his head. Please feel free to donate through Box 262478 San Diego, CA 92196-2478.

I took off the metal plate (mine wasn't epoxied on) an there was a few chips, one of which had UNIDEN written on it. What program do you use to decode. are you going through the sound card or to a 2 level decoder and then to the serial port?

If Radio Shack scanners were any good, you wouldn't see anyone selling theirs.
This guy is ready to try and pawn this piece of crap onto someone new in the hobby
and get himself a real scanner now.

Note the other post where someone doesn't like his Radio Shack scanner either.
Seems to be a lot of posts like this on here all the time.

934. FOR SALE: RADIOSHACK PRO-95

Newsgroup: rec.radio.scanner
Date: 2003-01-20 16:59:31 UTC
From: bobar8@aol.com
Message-ID: <20030120115931.05527.00000112@mb-mp.aol.com>
Source record: 38217

Brand new pro-95 1000 channel with box and all accessories:
Features:
• 1000 channels
• Power save
• Key tone on/off
• Alpha-numeric display for ID tagging allows frequencies to be easily identified by the name you assign to them
• Triple conversion Super heterodyne receiver virtually eliminates image-type interference
• Frequency Coverage: 25-54, 108-136.9875, 137-174, 216-225, 406-512, 806-960 (excluding cellular) and 1240-1300MHz
• Digital weather alert indicates watch, warning, statement or test statement along with 7 preprogrammed NOAA WX stations
• Power: Requires 4 “AA” batteries or adapter: AC #273-1767/C, DC #273-1810/C
• Jacks: Earphone, PC interface/cloning, antenna (BNC), external power
• Includes: Detachable flexible antenna, belt clip, two battery holders
• Size: (less antenna) 6-1/2×2-5/8×1-3/4"
• Includes: VHF Lo/Hi, UHF, VHF-Air, 800MHz, Dual-Trunking, Extended Coverage

WILL SELL FOR $155.00 FIRM + $8.00 INSURED SHIPPING CONUS

THANKS

That's very true!

I used to frequent a certain hill in SoCal that overlooked the 5 freeway - it was perfect for using the CB all over the valley that I grew up in.

Well, about 2AM one night I'm up on top of this hill listening to the scanner and chatting on the CB when this guy comes storming out of his house with a baseball bat in his hand demanding that I stop "prank calling" his house! I told him he was nuts and he threatened to call the cops. I said "Go ahead! I don't have a cellphone, I couldn't possibly be prank calling your house!" (this was back when cellular calls were in the $1.50 a minute range and the phones were $1000)

So I waited for the cops to come and the officer who responded happened to be into CB as well. He had the guy get his phone and had me key up and I just stammered "I'll be damned" as that phone started to ring... apparently the phone and CB shared a common IF frequency and my keying up made his phone ring. Then when he answered it, he said he could make out some of what I was saying and thought I was talking to him! I was amazed. I apologized to the guy and left quite embarrassed!

Hey, I'm NOT a fan of radio shack stuff!!!
BUT....
For your info, the 2006 was and still is the best scanner
radio shack ever had built for them. The interface could have been more user friendly
but the receiver was excellent!!
Besides, if you lost interest in a hobby would you sell off the equipment in time??
Many would.

There was a burger king across the street from the bank I worked at. It was hillarious listening to the drunks and other idoits on a friday night ordering their food and fighting with the employees. Old people who cant hear, and those guys screeming about how long it takes to get through thedrive thru. Its also fun to hear a person place an entire order only to be told they have ordered McDonalds food at a Burger King. And then there are the employees ragging on the customers and poking fun at them...if they could only hear!

Its not as exciting as a high speed chase, but it had its moments.

Geez, I see Icoms and Kenwoods and Yaesus and even Motorola radios offered for sale here, some of them quite recent; are you saying that they're all crap? What is your basis for that statement?

The only shortcoming of the GRE-made PRO2006 is that it pre-dated "trunk-tracking". Maybe he needs a newer scanner with that feature for his area?

Today RatCrap sells Uniden Bearcat scanners. When someone offers one of them for sale are you gonna give them a hard time, too? You have a lot to learn!

> > Also, saying something is the best that "Radio Shack" has ever marketed,

So you'd keep a PRO2006 even if all the communications in your area went to 800 MHz trunk-tracking? What would you use it for?

> > Uneducated consumers buy shit, then want to pawn it off on someone else.

Maybe because they don't have any Uniden scanners to sell? There's a reason people offer things for sale.

You seem to have a real problem with Radio Shack, but you obviously don't know anything about their stuff. (Hint: Like Sears, Radio Shack doesn't manufacture anything themselves.)

> > Use it as a paperweight. Perhaps it will work for that purpose without
> any
> > problems.

Sure, you can keep every piece of radio gear you ever bought. They make great bookends, doorstops, or paperweights. Many of them also generate a lot of excess heat to keep the shack warm. But it's not practical for most people to keep everything they ever bought.

It's simple: If you don't want to buy it, don't buy it. There's no need to denigrate the item or the seller.

Hi,
I'm a big fan of the BC9000, I have two, and recently bought 2 780's,
The 780 is everything the 9000 is not. PC programmable, does DPL, Bank and
channel tags. I love my 780's and highly recommend them.
It still has the VFO feature which also serves to change the channels just
like the 9000.
They are about $300 new, so I wouldn't pay more than $250 for a used one,
now that the 785's are out.
Best of luck,
Lou

I'd like to know if there will be a UBC785XLT?

Does anybody have the RX sens specs on the UBC780XLT? With the filtering to eliminate cellular "images", the 800 MHz sensitivity on the BC780XLT really sucks (.75 uV SINAD!).

Hey, I'm NOT a fan of radio shack stuff!!!
BUT....
For your info, the 2006 was and still is the best scanner
radio shack ever had built for them. The interface could have been more user friendly but
the receiver was excellent!!
Besides, if you lost interest in a hobby would you sell off the equipment in time??
Many would.

If Radio Shack scanners were any good, you wouldn't see anyone selling theirs.
This guy is ready to try and pawn this piece of crap onto someone new in the hobby
and get himself a real scanner now.

Note the other post where someone doesn't like his Radio Shack scanner either.
Seems to be a lot of posts like this on here all the time.

Hi,

I'd like to get in contact with the programmer of 'PDW',
the pocsag/flex/ermes decoder.

Unfortunately this program isn't updated anymore, I was
wondering if the source is available.

One of the missing options is the displaying of group-pages
when decoding FLEX, you only see the groupcode, but not
the actual capcodes. PocFlex and WinFlex have already
been modified, but since PDW is also very populair, it
would be great for lots of people to have this option
(and maybe other options) in PDW.

Bye, Peter Hunt (Holland).

[By *Sterling*]

The purpose of this article is to explain how to use a scanner and
radio
receiver to eavesdrop on private calls from homes, offices, cars, ships,
aircraft, and trains. I will discusses the best methods of monitoring, the
equipment needed, and list the necessary frequencies.

Why scan?
---------

It is quite a simple, and in most cases LEGAL, to listen-in on
cellular,
cordless, ship/shore, air/ground, pagers, etc. The benefits of such
monitoring, aside from entertainment, can be quite high to the discerning
listener. Callers quite often route to their favorite LD carrier to place
long
distance calls. They call their voice mail systems, private company
lines and diverters. If you are have a specific interest in an individual
or
company you may peek in on their "private" conversations, learn who they are
calling and what they are up to. Apart from radio-telephone communication
scanner hobbyists are entertained by whatever they overhear on their radios.
Police cars, fire engines, ambulances, armored cars, trains, taxis,
airplanes,
and buses are all equipped with radios and you can listen in on them. You
can
monitor the local police and fire departments to hear about events before
the
news reporters screw them up. Hostage dramas, bank robberies, car crashes,
chemical spills, tornado sightings are all there.You can hear a high speed
police chase, Secret Service agents on a sting operation, and undercover FBI
agents as they stake out a suspect. How about listening to a presidential
candidate discuss strategy with his adviser from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting in the 167 MHz
range? Listen to your neighbors deal drugs over their cordless telephone,
```

or
as their conversations are picked up and transmitted over the airwaves by
their
sensitive baby monitor intercom. It's all there in the 46 and 49 MHz
ranges.

What Equipment is needed?

Scanners are available in two varieties: crystal controlled and
programmable. The crystal controlled models are cheaper, but require the
user
purchase and install a $5 crystal for EACH frequency of interest.
Programmable
(synthesized) units don't require crystals and usually have a keypad that
permits you to store frequencies into channels. Programmables are now so
cheap
it doesn't make sense to buy a crystal unit as your main scanner unless you
get
it for under $45 or so. You can get a battery operated hand held scanner, a
bigger "base" scanner which is powered from an AC outlet, or a mobile
scanner
which connects to your auto's electrical system.

Make sure your first scanner:

1. Has a "search" feature, which allows it to search all the frequencies
between two frequency limits of your choosing. The lowest cost
programmables can't search.
2. covers the 800 MHz band, which is where cellular-telephone is
broadcast.
3. Has an AC-adaptor available, as scanners eat batteries.
4. Has an earphone jack as you may want to record your findings.

If you're not sure whether you'll like scanning, don't want to spend
much
money, a 16 channel radio will do. In general, the more channels and banks,
the better. Deluxe scanners can be controlled by a personal computer,
although
this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT
(a/k/a 950XLT) and Radio Shack PRO-2022 and PRO-2006 base/mobiles, and the
Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-37 portables.

All scanners come with a built in antenna, permitting reception up to
about 20 miles or so. Outdoor antennas can extend reliable reception to 100
miles or more.

A breakdown of exactly what there is to listen to out there:

Cordless phones:

It seems like everyone has a cordless phone now days. Cordless phones are
quite easy to monitor. Cordless phones are duplex, they transmit sound from
the handset to the base, and the base transmits both callers voices back to the
handset. Obviously this is the frequency you want to listen in on. Cordless
phones are broken into ten channels. They are as follows:

Channel Frequency (in MHz)
---
1 46.610
2 46.630
3 46.670
4 46.710
5 46.730
6 46.770
7 46.830
8 46.870
9 46.930
10 46.970

Most cordless phones have the channel number stuck on the back of the handset,
and some have multiple channels. The easiest thing to do is simply scan the
whole list of ten. The main problem with cordless phones is the range. They
are seldom able to broadcast further than a block or so away. If you want to
monitor a users phone calls, the best method is to hook up a Voice-Actuated
Cassette recorder to a handheld scanner, wrap the whole combo in a ziplock bag
and lay it in their shrubs. Come back the next day and you have a complete
record of all calls made and received on their cordless. With the use of a
touch-tone decoder you can even determine who they have been calling!

Cellular Telephone:

Cellular telephones are quite useful sources of information. Doctors,
lawyers, the phone company and business officials all regularly use celluar
phones. LD cellular calls can be quite expensive to say the least, so most
users prefer to use Sprint, AT&T, etc. as their long distance carrier. Thus
you can quite often hear them giving out their calling card number to the
operator.
Here is a method of determining which frequencies are used in a cellular
system, and which ones are in what cells. If the system uses OMNICELLS, as
most do, you can readily find all the channels in a cell if you know just one
of them, using tables constructed with the instructions below.

Cellular frequencies are assigned by channel number, and for all channel numbers, in both wireline and non-wireline systems, the formula is:

Transmit Frequency = (channel number x .030 MHz) + 870 MHz
Receive Frequency = (channel number x .030 Mhz) + 825 Mhz

"Band A" (one of the two blocks) uses channels 1 - 333. To construct a table showing frequency by cells, use channel 333 as the top left corner of a
table. The next entry to the right of channel 333 is 332, the next is 331, etc., down to channel 313. Enter channel 312 underneath 333, 311 under 332, etc. Each channel across the top row is the first channel in each CELL of the
system; each channel DOWN from the column from the the first channel is the next frequency assigned to that cell. You may have noted that each channel down is 21 channels lower in number. Usually the data channel used is the highest numbered channel in a cell.

"Band B" uses channels from 334 to 666. Construct your table in a similar
way, with channel 334 in the upper left corner, 335 the next entry to the right. The data channel should be the lowest numbered channel in each cell this time.

You want to tune-in on the non-data, RECEIVE channels. The transmit channel is a low power signal from the mobile source to the microwave tower, which rebroadcasts both caller's voices. The Data channel is used to send such
things as the callers serial number, and connecting cell information, this information is not audible, though I hope to discuss this in depth with a later
article.

Scan from around 870 MHz to 894 MHz and note any signals you receive. Once you find a frequency listed in the following chart, you know that your area also uses all other channels in that cell for that particular band.

Cellular Phone Band A (Channel 1 is Data)

Cell # 1

Channel 1 (333) Tx 879.990 Rx 834.990
Channel 2 (312) Tx 879.360 Rx 834.360
Channel 3 (291) Tx 878.730 Rx 833.730
Channel 4 (270) Tx 878.100 Rx 833.100
Channel 5 (249) Tx 877.470 Rx 832.470
Channel 6 (228) Tx 876.840 Rx 831.840

Restoring cellular reception.
Some scanners have been blocked from receiving the cellular band. This can be corrected. It started out with the Realistic PRO-2004 and the PRO-34,
and went to the PRO-2005. To restore cellular for the 2004, open the radio and turn it upside down. Carefully remove the cover. Clip one leg of D-513 to
restore cellular frequencies. For the PRO-2005, the procedure is the same, except you clip one leg of D-502 to restore cellular reception. On the PRO-34
and PRO-37, Cut D11 to add 824-851 and 869-896 MHz bands with 30 kHz spacing

All these are described in great detail in the "Scanner Modification Handbook" volumes I. and II. by Bill Cheek, both available from Communications
Electronics Inc. (313) 996-8888. They run about $18 apiece.

Pagers:

Pocket pagers and the like operate in the area of 150-160 MHz.

Phone-Patches:

A phone patch is a way to use a telephone via two-way radio. Basically how
it works is the patch is connected to a repeater and a phone. The patch will
interpret signals from a transceiver to activate itself and call out to the desired party. This then allows the person with the transceiver to call anyone
from his handheld radio unit. Phone-Patches are usually located on most bands,
as they are simply an attachment to the repeater.

Police, Fire, Ambulance and the like:

The easiest way to find these frequencies is to go to Radio Shack and buy

their listing, it runs around $8, and is set up for groups of neighboring states. Hell, photocopy the pages you want and then return it! But generally
these are located in 450-460 MHz.

Typical Band Usage:

The FCC dictates who uses what bands for radio broadcast. Following is a
breakdown of the general distribution of FCC licensing. These are by NO means
set in stone, there are always exceptions.

Abbreviations:

BA Remote Broadcast (Radio & TV)
CA General Mobile (Radio)
CAP Civil Air Patrol
IB Business
IF Forest Products
IM Motion Picture Industry
IP Petroleum Industry
IS Special Industry (Construction, farming, etc.)

44.62 - 46.58 PP,PO,PL,PH,PF,PS
46.61 - 46.99 USA,UIL,BIFC,UAF,UAR,UGX,UGF
47.02 - 49.58 PH,PS,IS,IW,IF,IP
49.61 - 49.99 UIL,UAR,UGC,UAF,UAR,UGX,UGF,USA

150-173 MHz:

150.775 - 151.985 PM,LA,IF,PH,PO,IS,IB
152.075 - 152.840 PM,RC,LX,IF,IB,RT
152.870 - 153.725 IM,IS,IP,IX,IF,IW
153.740 - 156.240 PL,PF,IS,IB,PP,PM,PH
156.255 - 157.450 IP,MC,MS,MG,MP,PM
157.470 - 158.700 LA,LX,IF,IS,IB,RT,IW,IP,IX,IT,RC
158.730 - 159.480 PP,PL,PH,PO,IP
159.495 - 161.565 LR,LJ
161.580 - 162.000 IP,MC,BA,MP
162.025 - 173.987 MISC GOVT AGENCIES

406-512 MHz:

406.125 - 419.975 MISC GOVT AGENCIES
450.050 - 450.925 BA
451.000 - 451.700 IW,IF,IP,IT,IX
451.725 - 452.175 IS,IF,IP,LX
452.200 - 452.950 LX,LJ,LR,LA
452.975 - 453.975 IY,PL,PH,PF,PO,PP
454.000 - 457.600 IPI,RC,RT,RA,BA,IB
458.025 - 467.925 PM,PP,IB,IX,IF,IP,IT,IW,GM
482.000 - 508.987 MISC PUBLIC SAFETY

800 MHz:

Unlike lower bands, the 800 MHz band is allocated on a first-come
first-serve
basis. There are two categories for licensing: Public Safety and
Industrial.
Sytemsusing one to five channels are conventional. Five channel systems
might
use trunking, but all systems with more than five channels must use
trunking.

851.0125 - 855.9875 Conventional Systems
856.0125 - 860.9875 Conventional or Trunked
861.0125 - 865.9875 Trunked Systems
866.0000 - 869.9999 Reserved-Satelite
870.0000 - 896.0000 Cellular Telephone

One more try for someone that knows where I can find the MDTMon source code. I'm building an app that I would like to use the MDTMon as a baseline. I'm not interested in decoding the MDT transmission, just like the MDTMon presentation. Please post or send email.

Ok, This is the second time this has happened. I go to get into my car (ford escort wagon) and through the passenger front speaker I hear " RRRIIIINNNNGGGG,RRRRRIIIIINNNNNGGGGG,RRRRRIIIIINNNNNGGGG, Hello BLAH BLAH BLAH " What is happening here ? I am getting cordless ph. conversations on my auto speaker. The car is shut off , radio off and the keys out of the ignition. Has anyone else ever heard of this happening ? Evidently my speaker is getting a freq. close to the cordless ph. correct ?
I just thought this was pretty wierd or maybe it is not that uncommon.

This is strange for several reasons. An amplitude modulated signal is easily detected by something like a cold solder joint.

Most cordless phones use FM. Also the power required to make it audible on your speaker would have to be significant or really close. While FM can be detected via "slope detection" on an AM detector, it would take a rare set of circumstances for your car radio speakers to act as a slope detector.

I would be looking for a neighbor that has either homebrewed or purchased a "range extender" for their cordless phone.

Let us know what you find out!

Nope, that's the old DOS based MDT program that required a slicer. I never did get that one to work...

I know what he's looking for - I used to have it! I wish I still did, great program and the code was done very well...

Let us know if you find it colocat!

30-50 MHz would be FM
138-144 MHz would be AM
225-400 MHz would be AM execpt for MilSats which then are FM.

Just how old is this document??? AirForce One hasn't used the
radiophone link in 6+ years! And the exact freq was 415.7000 MHz. It
was fun to listen too however and was very active....But now isn't used.

978. Trunking help please, I'm stuck..

Newsgroup: rec.radio.scanner
Date: 2003-01-22 02:15:30 UTC
From: Scott <nope@haha.com>
Message-ID: <69nX9.80795$eB1.3363750@twister.southeast.rr.com>
Source record: 38160

I have a 780xlt scanner and I can not seem to get the trunking figured out to save my life. I went through the steps several times in the book and have yet to have any luck getting any frequency to take.

I live near Durham NC which is a type2 motorola and I have the following freqs for Durham,
851.1625 852.9625 854.5125 854.9625 855.4875 855.7375 856.2125
856.2375 856.9625 857.2125
857.2375 857.9625 858.2125 858.2375 858.9625 859.2125 859.2375
859.9625 860.2125 860.2375
860.9625

When I put in a frequency and hold down the trunk button for two seconds, it beeps and says ERROR, OUT OF BAND. Any ideas?

Is there something I am missing to get this to work? Any help would be appreciated.

Thanks, Scott..

In my old 88 Blazer, the radio did a couple of weird things like this,
with it on, in between any FM station, where it was muted, you could
yell inside the car, and you would hear a distorted "echo" come from the
speakers at a loud volume. I found this out when I was driving along
and was hitting the tune button and some guy in the next lane drifted
over, and I honked the horn, and heard it come out the speakers. This
radio still does this, my friend has the Blazer now.

The other thing it did was, with it off, was suddenly start, at a low
volume, start spouting trucker CB audio. It was crystal clear, and
dissapeard as soon as you turned the radio on. This dissapeard when I
yanked the radio out to have it checked for the echo problem and put it
back in after they found "no problems".

Dont know how old it was, just a post for discussion.

Thanks and love your website. I recently bought a Bearcat 3000xlt wideband handheld and used some of the vhf/uhf freqs on your website to tune in the aircraft here on Ft. Drum.

I'm trying to gather some frequency information for a friend. He's looking for the frequency that Spirit Air med-evac helicopters are using to communicate with St. Joseph's hospital in Marshfield, WI (Wood county).

Any help would be appreciated!

Thanks, Michael N9BDF

I don't think it is one person's homebrew. As I have been in two different locations when it has done this. One was in my back yard and one was about 4 blocks away.
UNLESS, someone is putting out some high wattage cordless ph. signal.
Wouldn't that be ignorant :-)

A co-worker of mine has asked for help in selling a collection of scanners he has saved up over the years. He just wants to know fair asking prices. He has no Internet access and has asked for my help. Checking eBay takes far too long and people list things in so many different ways that it is nearly impossible as a guideline.
So I ask...are there any sources of "price guides" for used scanners? It seems he has mainly mid-80s to mid-90s Unidens with a few Rat Shack base/mobiles in the lot.
Thanks in advance for any help...

>God bless!

The whole "Fox Mike" band spectrum is 30-87.975MHz, and the radios don't use the standard (5kHz) NBFM. I think the deviation is something lke 15 or 30kHz. So if you use NBFM, it'll probably sound a little 'fuzzy,' but it works. Search in 25kHz steps.

Lots of military traffic in the spectrum is spread spectrum now (freq hopping) via SINCGARS & MSE, but there's definitely some analog voice in single channel mode traffic to be heard.

Most of what I hear in that range are Helo Air-Air. Also A-10's use
30-50 FM to talk with ground forces. Not a very active spectrum however
here in Florida we pick up some comms from time to time.

>handheld transceiver that is giving you the blues.

Speaking as a ham radio operator who has constructed spread spectrum
radios, I would like to dispell a few myths primarily made up by
ignorant marketing staff who are trying to play your ignorance to sell
you more stuff.

1) Spread spectrum is secure. WRONG!

Yes, it's secure from casual scanning, but it doesn't stand a
chance against a similar chip set on another phone. And if
you think each phone uses a different chip set, I have news:
They don't.

2) Spread spectrum can't be interfered with. WRONG!

Like the wideband broadcast FM signals, it does have a sort
of "capture effect" going for it. We call that effect
"process gain." A coherent signal source would need a few
extra dB of strength equal to the process gain to overcome
an equivalent spread spectrum signal --but it WILL get
through. Further, most consumer spread spectrum systems are
optimized for FCC Part 15 compliance, not process gain.

3) Spread spectrum is more spectrally efficient than narrowband
communications. WRONG!

Shannon's limit plays an important role here. A spread
spectrum signal uses different parameters, so it's trade offs
are different. But it still has some problems, particularly
the Near/Far transmitter issues. Further, spread spectrum
radios can't take nearly as much advantage of resonance to
improve dynamic range as a conventional narrowband receiver
could.

4) A spread spectrum phone has millions of codes. Well, not really.

It's really one long sequency and the start phase of the
sequence is what they claim is a "code." It's really one very
long recycling sequence which takes all of a fraction of a
second to send. A phone that loses lock on the base could

easily lock up on someone else's base if it were available.

So what's spread spectrum good for? Well, it's a good way to layer consumer products on to reusable spectrum. It's also a good method to use for multiplexing signals, such as for Personal Communications Services (PCS).

It's not a bad way to set up LANs, as long as security isn't a major issue.

So spread spectrum has its uses, but it will never displace conventional narrowband communications.

73,

Jake Brodsky, AB3A mailto:frussle@erols.com

The clicking sounded exactly like the handset being pressed and released as described by hiker5@webtv.net above. As for how do I know it is the neighbor, I have this response: (a) we get along fine with everyone else, (b) the clicking is irregular and suddenly increased in intensity when I mentioned his name, and (c) these people regularly come into my yard and do low-level vandalism, such as breaking a couple of branches of the trees, dropping Coke cans over the privacy wall, etc. Several times they have arranged a pattern of old chicken bones under our shrub which is adjacent to their house. Kids? Maybe, if we hadn't witnessed the wife actually throwing stuff over the fence a couple of times. And yes, we've witnessed this and called the cops, and the response is always that it isn't serious enough to prosecute. The homeowner's association won't do anything -- not surprising, because the wife sits on the Board. Why would these people do stuff like this and give clues as to who they are? You'd have to ask them. This all started because my wife stopped giving their daughter a free ride to school. Go figure.

As for your suggestion to use a real phone, we've taken that suggestion already.

1001. HUMOR: Tonight's Scanner-related Top Ten List

Newsgroup: rec.radio.scanner
Date: 2003-01-22 19:44:18 UTC
From: David Letterman <david.letterman@cbs.com>
Message-ID: <mwCX9.566$QV3.33377@news2.west.cox.net>
Source record: 38185
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Top ten ways to tell if your car was manufactured by the same company that manufactured your scanner:

10. Your car is computer configurable and controllable, but you have to either buy third party software or write it yourself. If you try to write it yourself, the protocol is not available from the manufacturer and your dealer has the wrong interface cable.

9. The car will come with a stripped down version of the configuration software that doesn't work. If you want the one that does, your dealer will charge you 1/3rd of the cost of your car to "upgrade".

8. Your speedometer has an uninterrupted range from low end to top end but the car inexplicably jumps from 55 to 80 MPH. The manufacturer will cite compliance with federal law to explain this. Cars they built before 1985 do not do this.

7. Putting your car in gear requires pressing a FUNCTION or PROGRAM button first, then you have to type in the gear you want, down to 5 decimal places.

6. Your owners manual will be poorly translated from Japanese by an overpaid consultant. It will only cover the basics, leaving out such luxuries as how to use the accelerator or turn signals.

5. To drive around in an unfamiliar city, you first have to tell your car what kind of roads the city has or it will stop moving unexpectedly. The owner's manual will outline how to do this in 23 easy to follow steps.

4. If you choose to configure your car by hand rather than using the third party software available, it will take you 2 weeks to set up your stereo presets, another week to adjust your seat and mirrors, and so on.

3. Someone will tell you if you hold down stereo preset 1 and honk the horn while turning the key, your car will go faster. Don't fall for it - if you do you'll just reset the car and get to spend the next 2 weeks plus setting it up again.

2. The manual will provide a 900 number that you can use to configure your car automatically over the phone. When you call it you get a recording that says this number has been disconnected and is no longer in service.

And finally, the number one way to tell if your car was manufactured by the same company that manufactured your scanner is:

1. To drive on the newest freeway system requires an additional aftermarket part that costs just as much as the car itself.

Thank you and goodnight!
-Dave

I'm not asking to start a long thread about scanner values, just wondering if someone already has a database going. There are roughly 30 radios he has...off the top of my head: Uniden SC150, BC175XL (odd looking base with not many channels), Rat Shack PRO2046, PRO2021, PRO62, PRO60, Uniden BC760XLT (late model). There are many more but I can't recall at the moment.

Is the lack of a socket for external DC power a plus or a minus in a
portable receiver? On one hand one has to rely on batteries, but on
the other one avoids interference from transformer waves? Is that why
there is none in the report I read on the IC-R2?

I am probably making this more difficult for myself then it needs to be, but I have still yet to completely comprehend what is "Trunking". I know that trunking is a way for many users to be able to alocate a limited number of frequencies, but I don't understand exactly how this is done. Is it that one frequency is used for many people simultaneously, synomous to a router with computers which will break one IP address into many IP addresses to be used at once? Or is it that thier are a limited number of freqs, say 5, that are allocated but "intelligently" distributed to users? I don't see how the latter could be useful in serving thousands of users, but you tell me. If anyone has any useful links/info about Trunking or Trunk Tracking, please don't hesitate to share.

I was just on Rich Wells site to see the differences between these scanners. Other than the fact that the 2006 scans 26 ch/sec and the 2005 scans 16/sec, they look identical, both physically and specs wise. The 2004 is obviously different yet similar. Anyone knowledgeable with these 3 that can point out the differences between the 2005 and 2006?

Generally how many frequencies are allocated to eachorganization/user pool? I'm sure its mandated by the FCC. Surely you would need many frequencies for more than one-thousand users. I am also aware there are different types of trunking systems. What is the difference between some common systems such as motorola and EDACS, and do any act in a way synonomous to ip-routers like I had initially suggested (i would probably suspect the digital systems of doing this if it is possible.)? Thanks Mark.

Anyone know if a AC TV Amp (on sale for $5 at Radidio Shack) can be used
for scanner? Box says 50-400 Mhz which is what I want to use it for.
DB gain is 8db. Will have to buy adapters to get it to connect to radio.
Amp runs on 120v ac. Thanks

Seems a cheap way to improve reception if it will work!

For $5 I say go ahead and try it - you won't be out much if it doesn't!
You'll hear others tell you it'll oveload the front end of the scanner, and
yada yada but how else will you know unless you try it for yourself? I've
used a signal booster in a mobile set up before, and it worked pretty
good... If I started getting intermod I just turned it off and all was
well....

Sometimes these things help, but most of the time, it's a wasted
effort. If you're using more than, say, 100' of lossy coax to get to
your antenna, then you might get some use out of placing an amplifier
at the antenna.

In truth, I've yet to see these products improve signal quality in an
installation --TV or scanner. Wideband amplifiers usually don't help
unless you really live out in the middle of nowhere, there are no
strong signals anywhere nearby, and you have lots of lossy coax to
feed through.

But as the anonymous gentleman said, for five bucks, it's worth a try.
Just don't get your expectations up too high.

From: Skweezieweezie <noway@thistime.now>
Message-ID: <eLidnWk5U5x8x62jXTWcoQ@comcast.com>
Source record: 38084

The 2006 uses a faster CPU and an additional IC-switch
to change the resistance value for the hysteresis-loop in the
squelch circuit. Aside from that, it's the same as the 2005.
The 2004 and 2005 share the same circuit diagram, with the
2005 being mostly SMD's and in a plastic case.

1051. TK 500 problem...I can't read from the radio...

Newsgroup: rec.radio.scanner
Date: 2003-01-23 21:34:52 UTC
From: Bruno <mongkon.anousak@skynet.be>
Message-ID: <3e305ffa$0$13074$ba620e4c@news.skynet.be>
Source record: 38085

Dear All,

I just received a cable to connect to my Yaesu VR-500 that I ordered from RT Systems.
Unfortunately, I'm having a problem to use it with the TK 500 program...

I connected the cable to the serial port of the computer and the other extremity in the speaker jack of the scanner.
Then, as I understand it, I first have to read the radio.
So I press simultaneously 1,8 and ENT while putting the radio "ON".
Then I click "OK" on the window in TK 500 (as asked) and press 2 on the scanner "TX CLONE".
After a few seconds, it tells me "CLONE [TX] ERROR
and the "reading vr-500" window remain at 0%

am I doing something wrong?

Is there a special configuration to put in the scanner menu?

Thanks for your help,

Bruno

> & address when you go to get one of their free batteries.
>
> Who Me?

I used to give them my work address and telephone.
Of late however, I've not stepped into one of their
stores in over 6 Months. No need to do so either.
The two RS outlets near me no longer carry electronic
components, RF connectors, technical books, even the
scanners are now gone and have to be special ordered!

All they now stock rict Consumer type goods.
Sprint Telephones, Home Dish TV antennas
and toys. Not much else. All junk you can
get for half as much $$$ at the local WalMart
and with a much better warranty also.

At this point, I wouldn't shed a single tear if RS declared
bankruptcy and closed 70% of their stores. They have
become another redundant and overpriced copy of the
defunct "Circuit City" retail chain - staffed by a youthfull
employee base which "ain't got a clue". A sure fire course
to retail business oblivion.

I'll give RS two Years before they file Chapter 11.

Yes you are doing it wrong. You DO NOT need to press any buttons on
the radio. Just plug it in and then in win95 click on the scanner
button at the top then upload or download. When its done just unplug
the cable from the scanner and your all set to go.

My experiences with the LOCAL rat shack here in Ny is that most
(90%) of the employees could care less about helping the
customer. If they have something in stock, sure they will
sell it to you because the salepeople here work on commission.
Try asking them if another rs in the area has it, and they say
"we can sell it to you here (ie so I can get my commission)
and you can go get it there." My usual response is
"if I have to go there to get it, I will pay for it there
as well"

I do like rs, just not the "sale people" (some call em droids)
who could care less about the customer. Most of the
"sales people" here are teenagers.

God bless

Would be used with my handheld, less than 2 ft of coax, and the antenna
would be mounted on
the terminal (with a bnc adapter of course) of the amp.

Nextel's DirectConnect system operates pretty much like any other TRS.

1062. Area 51?

Newsgroup: rec.radio.scanner
Date: 2003-01-23 23:20:20 UTC
From: Free & Accepted Mason <fightfanNOSPAM@twcny.rr.com>
Message-ID: <UM_X9.261$7A4.236551@twister.nyroc.rr.com>
Source record: 38096

What follows is the United States Government's official statement
regarding Area51 and it's alleged purpose.

"Neither the Air Force nor the Department of Defense owns or
operates any location known as "Area 51." There are a variety of activities,
some of which are classified, throughout what is often called the Air
Force's Nellis Range Complex. The range is used for testing of technologies
and systems and training for operations critical to the effectiveness of the
United States military forces and the security of the United States. There
is an operating location near Groom Dry Lake. Specific activities and
operations conducted on the Nellis Range, both past and present, remain
classified and cannot be discussed publicly.

In connection with the litigation regarding the operating location
near Groom Dry Lake, the Air Force has stressed its commitment to protecting
the environment and national security. We believe these goals are not
incompatible. The Environmental Protection Agency (EPA) and state
environmental regulators with appropriate clearances have inspected the
operating location and monitor the Air Force's efforts to further assure
compliance with environmental laws. The court held that EPA conducted a
"thorough inspection" and that the Air Force is adequately providing
information to EPA concerning the operating location. On several occasions,
the court has also held that the Air Force has properly classified
information concerning the operating location."

Now email me for coms recorded at area 51 (military ops!)

> But, don't take a scanner inside a gambling casino.

Why not? I do every time I go. I take mental note of all the machine numbers that I hear consistently paying off, and then go play those machines. Casinos will tell you on TV that it's random, that they have no control over it, but that's a load of crapola. They can and do rig them, especially the indian casinos that aren't subject to state and federal gambling regulations. They also plant people in the casino that just win and win and win... in the hopes you'll sit next to them and blow your paycheck.

I just stick it under my coat and use headphones. I bop my head now and then to some imaginary music and no one is the wiser..

1071. Pro-2006 case needed

Newsgroup: rec.radio.scanner
Date: 2003-01-24 00:26:18 UTC
From: Scott Livingston <bscout@charter.net>
Message-ID: <v3121g5qmgm125@corp.supernews.com>
Source record: 38105

Hello to group.....I'm helping a friend try locate a decent looking case or at least the top half for his 2006. The original was left on the dash of unvented car in summer. Wow, I didn't think it would but it sure did warp up some. If you have one to part with I would like to hear from you...Thanks, Scott here or at bscout@charter.net

1072. Channel order recommendations

Newsgroup: rec.radio.scanner
Date: 2003-01-24 00:29:17 UTC
From: cocquit@aol.com
Message-ID: <20030123192917.13516.00000318@mb-fe.aol.com>
Source record: 38106

I've bought a Uniden 780XLT and was checking to see if anyone had any recommendations for setting up their channel orders, for both the trunk bands and the conventional bands.

I realize for the trunk bands you have to have the frequencies in a certain order.

However, from there, I wanted to get an idea what kind of order people setup their frequencies. Like, do you set it up with your city police first, followed by county, followed by state? And then your fire frequencies? I realize this isn't required for the scanner to function correctly, but just wondered what others preferences have been.

Heck, while we're at it, let's get Allied Radio back, too. Now, that was a store!

Man, I sure do miss the old Rat Shack from my youth. If it wasn't for them, I highly doubt that I would have the interest in radio, electronics, and even computers that I have today.

I guess I'm still a little lucky with my local RS store...

The store is actully "River City Electronics" and still carries most of the electronics that RS still has (which is getting dismal in selection). But I've made friends with the store owner and have suggested an alternate place for which he could buy some very useful stuff for me (www.digikey.com). Hopefully, he'll keep some of the fun stuff on hand and be a place for me to make special orders.

And the thing is... This is in a very small town of all places. If he goes to "just a kiddie toy store"... I'll do my kiddie toy shopping at Wal-Mart... I say,... he best keep the kind of toys *I* like.

Yes, the Chicago pd uses a trs, but it is mostly for tactical purposes (i.e. drug busts). Out here in bolingbrook I haven't heard a thing, ever. But if you live in chicago you probably could. Do a google search on CARMA and go to their site. Lots of good chicago information.

Thats so true for me. Starting off in electronics and radio was when I
saw a man buy a scanner in radioshack. I still go there for some things. The
manager is friendly with me and most of the sales assosiates are
knowledgable. Now the internet and 1-800-the-shack is a whole other picture.

Well I was a little behind time in the history area of Allied it says it was purchased by Electrocomponents of the United Kingdom, in 1999 but that may also be a Rat Shack Company, they own many companies, that people do noot know about.
Allied has a web site at
http://www.alliedelec.com/catalog/indices/product.asp

I see no reason for it not to work, in fact it's quite a good idea to
improve reception in that range.
The only possible problems that may be encounter are overload due to high
gain on the front end.
It all depends on you receiver when it comes to this problem.

Give it a try, for that price what have you to loose (other than the
$5.00) cheers, Ken, G4KIR.

The casino in Mt. Pleasant, Michigan is much of what you describe. Their slots are by admission tighter that the states requirements, and the fine is drastically smaller per day than the profit they are raking in. Dunno if I would call it Soaring Eagle or a Falling Buzzard......

1101. confused. fm broadcast stations in 62 to 65 MHZ

Newsgroup: rec.radio.scanner
Date: 2003-01-24 07:42:52 UTC
From: hiker5@webtv.net
Message-ID: <5062-3E30EE7C-181@storefull-2253.public.lawson.webtv.net>
Source record: 38134
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I am in the U.S. earlier tonight, I was scanning on an analog scanner, and in wide FM mode, I recieved several stations in the 62 MHZ to 64 MHZregion that were regular FM radio broadcast stations.

but I thought that the FM broadcast band didn't start until around 88 MHZ.

and to add to the confusion, some of these radio stations were in the tv channel 2 region.
A digital tv station does operate on channel 2 here, but is not audible on analog scanners, and does not multicast the radio stations I heard

(I also have a HDTV reciever, so I know what they multicast). plus some of the stations were out of the tv channel range anyways.

they are not AM broadcast stations or harmonics, since they are clearly in wide fm mode.

I don't think that they are FM broadcast harmonics as they are below the standard FM broadcast range, and the stations I was recieving were not in the standard 88 to 108 MHZband.

One was a Christian station. I know all the standard AM and FM (88 to 108 mhz) Christian radio stations in my area. The one I heard between 61 and 65 mhz was a different one, not recievable in the standard am or fm broadcast bands.

the other radio stations in the 62 to 64 mhz range was regular secular music and dj talk.

they are not studio to transmitter links, since the particular stations heard do not exist on the regular am or fm broadcast bands. they were different stations.

they did mention the city. and it is the large metro city that most of my regular radio stations come from.

they are not pirate radio stations, as they are constantly broadcasting 24 hours a day.

It was not the analog tv station channel 3. that's on 65 mhz, and they had a drama on.

It was not the cable tv stations nor any leaks from the cable tv stations, as the cable tv company here does not beoadcast the stations nor the programs I heard on these frequencies.

I'm sure they're not foreign since whenever the mentioned the city, it was the metro city that's local to me.

what's going on here?

and what in the world am I hearing from 62 to 65 MHZ?

Okay, explain to me why Radio Shack is the best. What features, functions, etc. make any of the RS scanners better then any of the Uniden or Icom or AOR, etc. scanners.

Have you done side by side comparisions between the bc780xlt and any RS scanner? Post some links that show comparisions between them.

Show me some facts man!!!

The winradio 1000e is different from the Icom PCR1000 the icom has usb.lsb
and cw and the winradio 1000e does not have that.
You can beter choose for the winradio 1550e , the winradio 1550e has almost
the same specs as the icom pcr1000
The winradio software is much better than icom , and the winradio has alot
of plugins calles XRS pluggins

I would go for the winradio 1550e (I also have the winradio 1550e) also
owned the icom pcr1000 but prefer the winradio

I usually hear them accidently on local police frequencies, which I find odd (you figure the cops wouldn't like that interference). It's also fun when you know people that work there, so you can bug them later about the big orders. "How HUGE was that guy that ordered 18 big macs?!!"

Source record: 38145

O.K., it's a long story, but I have two PRO-95's for sale:

1- This is the one I have been using. It is in immaculate shape, and the only diiference from a new one would be the piece of shipping tape I put over the plastic display lens to keep it from getting scratched. It will be shipped in it's original packaging with all stock accessories/manuals.
$165.00 + shipping from 11786.

2- This '95 is still in the shipping box as received from Radio Shack (mail order). I have not opened the shipping box, so I can honestly say this scanner is brand new and never used, (or seen!!). I will ship it as it was shipped to me and guarantee it not to be DOA.
$175.00 + shipping from 11786.

Thank you for reading my post and please respond off-list with any questions.

John

There is no free lunch here. Amplifiers will add to the noise floor
of any system they're in. Further, nearly all handheld scanners are
already as sensitive as they're likely to get. An amplifier will not
help in your situation.

Here's where a broadband amplifier could pay off: You have an antenna
far from the receiver. You're losing signal through the coaxial cable
itself. The goal is to make up for the loss in the coaxial cable.
You don't want more signal than that because it's unlikely that any
scanner can use it to good effect. At best, you won't hear much
degradation of weak signal reception. At worst, you'll get clobbered
with all sorts of signal overload.

Think of what happens when you drive a stereo input with too much
signal. The audio distorts. You can't hear the background nuances
because of all the hash the amplifier generates. Well, that's what
your scanner will do if you put a wideband amplifier in front of it.
You'll hear lots of spurious signals, and the weak signals will be
obscured.

Unless you really want a learning experience, I wouldn't even bother
wasting the five dollars.

Note the frequencies you heard them on.
Compare these to the actual frequencies the stations broadcast on.

You will probably find the difference between the frequency you hear and the announced frequency are the same for all the stations. Probably 21.4MHz.

If the difference is constant then you are hearing images - twice the frequency of the receiver IF below the actual frequency. The actual frequencies of 88.1 to 107.9 would appear 21.4 lower with a commonly used IF of 10.7

If you get a difference of some value other than 21.4, one half of that number should be the same as your first IF, which should be in the specifications for your receiver.

Dave

Can anyone who OWNS one of these tell me the average
use time they get from the batteries once they have
been charged? thanks

Why am I asking? My pro-93 runs 3-4 days (2-4 hrs a day!) on
1800 nimh rechargables...3000xlt runs like 4-5 hrs.

I live in the Northeastern USA (NY/NJ) and, not only have no stores been
closed, they are opening new ones all the time - like the brand new store
in Woodbridge NJ that just opened this winter.

1126. FA:RADIO SHACK PRO-62, 200 CHANNEL SCANNER

Newsgroup: rec.radio.scanner

Message-ID: <3E31A292.971484AA@optonline.net>
Source record: 38008

This scanner gives you direct access to more than 31,000 frequencies
including
police, ambulance, ham radio, and transportation services. You can
select up to 200 channels to scan, and change your selection at any
time. The secret to your
scanner's ability to scan so many frequencies is its custom-designed
microprocessor - a tiny, built-in computer.

Source record: 38014

Depends on what casino. Some have trunking while others use conventional. You have to look them up in a directory such as Police Call or try cityfreq, the FCC, etc.

Now what to listen for: Think about the last time you were at the casino and the machine was paying out. When the little light starts flashing on top, that signals the eye in the sky that either you won something too big for the machine to pay out or it needs service because it ran out of coins to pay you with, or they got stuck, etc. This generates a call for "service on #100". When that something is a big prize you won, they call someone else over to machine 100 to make you sign their little "I am 21 or older" form and then they pay you nice crisp $100's... THAT'S your cue to jot down that machine number.

Now this requires some patience: Keep listening. If you hear machine 100 being "serviced" alot or if they are sending Payout-Girl over there alot, then it's a good bet that machine 100 is running loose that day, so that's when you roam the casino and plop down at the machine with the little plastic tag on top of it that says "100" when it becomes available. They are cyclic, they run loose for so many spins and then tight for so many spins, so this is in no way an iron-clad system. But, chances are, if you keep feeding that machine, it WILL pay out, if the casino set it up that way.

This method usually works pretty well for me. If you go to Vegas, it's probably best do your research up in your room and leave the scanner up there while you gamble. But I usually just use headphones and keep the radio hidden. No one ever says boo about it.

I neeeeeeeeed to eleminate some of the noise on my pro-91. I turned on my old non-programable bc-1, and when they stopped on the same freq. , the the bc-1 came in crystal clear with a 7 inch rubber duck antenna. I heard you can add a capacitor somewhere on the speaker, but what is the value and type of the capacitor. Also how should I hook it up. Between the speaker spots where the wires are connected or like so:
< -----[capacior]-----(speaker)
<--------------------(speaker)

Thanks,
===Matt===

wrote:

>Nextel's DirectConnect system operates pretty much like any other TRS.

That's what their salesmen would have you think.

In reality, direct connect is a person-to-person service, more similar
to normal cell phone conversations than two-way radio. It just
establishes contact a little faster than dialing a number and waiting
for an answer.

TRS is a person-to-fleet service. With it, everyone knows what is
going on. The other officers know what call unit four-kilo-two has
been dispatched on, and will hear him if he calls for immediate
backup. If a plumber runs into an unusual problem, the rest of the
company will hear it first hand, and anyone who has encountered
similar problems before can offer advice. You cannot do these type of
things with a person-to-person service.

The success of direct connect has been due to effective marketing,
convincing customers who know little about communications that what
they have to offer is unique and spectacular, rather than actually
offering something which is unique and spectacular. The lie that
direct connect is the replacement for TRS, and that TRS will soon be
no more, has often been invoked in order to make a sale.

A follow up to that story, the F1 Poo-Bahs have relented somewhat,
allowing two-way voice for the 2003 season with car-to-pit telemetry to
end with the British Grand Prix in July. Pit-to-car telemetry is out
for the full season, though.

Several other non-radio related rules also take effect with the British GP.

I'm almost certain that it will not work. The 3000 has a different processor, not the UC1513A. You can't do this mod to any Unidens sold in the USA after an April, 1994 manufacture date. I modified lots of those scanners in the early 1990's....

It's really sad to see how Radio Shack has gone downhill. I remember playing on some store demo TRS-80 "Trash 80" Model II and III computers back in high school, learning how to program in BASIC as I went. The store owner knew I couldn't afford one of my own, so I'd show up every Friday and Saturday night after dinner and he'd just ask me "Ya gonna buy anything today?" with a wry grin, pointing the way to the seat in front of the computer. He'd even open up boxes of software -- some disk and some cassette (boy that's bringing back memories) to let me load them up and play with them.
It was such an exciting time of discovery, one that I wish I could somehow recapture.
Thanks to this fellow I learned how to program in BASIC, which led to some computer programming classes in high school, and that has led to three college degrees and my career in higher education.

In a way, those Radio Shack computers and that nice fellow in the mall started me on a path that has taken me to places of which I had never dreamed. To see it degenerate into a glorified DirectTV/Sprint PCS mouthpiece is sad.

That's funny, I haven't come across any digital Nextel traffic here in
Louisville, KY. Alot of it is in-the-clear so to speak. Nextel systems
across the river in southern Indiana are mostly analog too.

This scanner gives you direct access to more than 31,000 frequencies including
police, ambulance, ham radio, and transportation services. You can select up to 200 channels to scan, and change your selection at any time. The secret to your
scanner's ability to scan so many frequencies is its custom-designed microprocessor - a tiny, built-in computer.

30-50 MHz VHF Low
50-54 MHz 6-Meter Amateur Radio
118-136.975 MHz Aircraft
137-144 MHz US Government
144-148 MHz 2-Meter Amateur Radio 148-174 MHz Government (Local, State, Federal)
380-420 MHz US Government
420-450 MHz Amateur Radio
450-470 MHz UHF Low
470-512 MHz UHF-T Land Mobile
806-823.9875 MHz Conventional Systems
849.0125-865.9875 MHz Conventional/Trunked
866.000-868.9875 MHz Public Safety
894.0125-896.000 MHz Aircraft Passenger Telephones (AM)
896.0125-960 MHz Trunked

Hi,

I have added some new features to my program "Ar86ctrl",
that is available for free at my homepage:

http://www.an-netz.de/home/kbo/

Changes from v1.10 to v1.20

- save memory contents to text files in AOR's ".mem"
file format

- restore memory contents from ".mem" files, even if the
file is from another bank or smaller than the target bank

- cut or copy and paste a memory channel from a bank and
move it to another location in the same or a different
bank, using Ctrl-c, Ctrl-x, Ctrl-v

- memory bank resizing now supported
- tuning with the arrow keys accelerated
- several bug fixes

ciao
Klaus

I've have many different antennas and the best omni-directional ant I've found so far is the AntennaWarehouse ScanTenna (http://users.cis.net/kingpop/Scantenna.htm).

You'll probably have a lot of people tell you to get a discone. Discone's are ok antennas however I've had a wide varity of discones costing anywhere from $30.00 to $100.00 and they just don't compare with teh ScanTenna.

George
http://www.MilAirComms.com
PS: I have a PRO-2052 also and it does great on the ScanTenna.

1159. Trade Drake R8 for Wide Band Receiver like VR5000 or AR3000A

I have a Drake R8 Communications Receiver in excellent condition with original box and some computer control software that I'm not using and I would trade for a Wide Band Receiver like the Yaesu VR5000 or AOR AR3000A. I would think about the ICOM R7100 but not the R7000 model. I would like to get a model that has a frequency coverage from atleast 25 MHz to 2 GHz. Below 25 MHz is a bonus.

Sit down with Notepad or with a sheet of paper and
think about what your most interested in hearing.

I use Bank 1 for my Local PD & Every mutual aid freq
used in my state including NIPSAC.

Bank 2 Surrounding Cities PD\FD

Bank 3 Countywide Agencies Sheriff, Fire-Net .....

Bank 4 Cities in my County that are fringe

Bank 5 State Agencies

Bank 6-10 Surrounding Counties

Anything left over is for Feds, Frs or Aero

The key is what do you care about hearing.

1165. Pro-66 low battery warning

Newsgroup: rec.radio.scanner
Date: 2003-01-25 22:12:55 UTC
From: "Bob S." <spam@nospam.com>
Message-ID: <HZDY9.115936$Yo4.5525108@news1.calgary.shaw.ca>
Source record: 37948

I have a Realistic PRO-66 handheld scanner... This scanner has a problem with its low batter circuit.

When using Nicads or NiMH, the low battery warning actives and shuts off the scanner even though the batteries are fully charged.

I figure this scanner has a voltage sensor and it may be set a bit on the high side.

Has anyone else had this problem and figured out the low battery circuit so it can be reset or deactivated.

Cheers Bob.....

Got me to kinda thinking and wanting to ask.

What would be a good antenna to use within an apartment? I have a ground floor apartment, with good sized balcony
and am 3 blocks south of one VHF repeater array atop a building, and am about a mile west of another repeater
array, also on the VHF band (as determined from station locations listed). My flat is on the eastern exposure of the
building.

I've read about these spider web type of indoor antennas, but don't particularly want a 10 foot antenna going diagonally across a wall in the apartment although I could put one behind one of my bookcases. Certainly don't want anything that is butt ugly.

I could put a discone antenna on a tripod of sorts or probably use adjustable hose clamps to clamp a vertical antenna
to the outside rail, and run a cable through the window (with plexiglass filler in the window gap). Provided that the landlady doesn't complain. Other than that is there a god indoor antenna that I could use. I mean a good 800Mhz one that will
be able to get good reception from. Our emergency services and some otehr frequencies are primarly broadcast from
antennas at the 3000 foot level on a mountain that is about 10 miles north.

I'm close to buying a Bearcat 780XLT and want to get a good antenna for it. and will also go for a BC245 portable
hand held.

What would be a good antenna to use on a vehicle? I don't want to punch any holes in my trusty truck, and would rather
use an aluminum flange set on the forward end of the pickup truck box (held down and in place by the fiberglass canopy, so I could mount a CB antenna, plus perhaps another if need be.

Any ideas on either?

PK Clear.

Yes the ScanTenna is a strange looking antenna however its by far the best I've used (not counting beams). I've never been a fan of discones, a lot of people like them however they offer no gain.

I think Antennawarehouse.com will sell outside of the US, check out their website and email them to see. I've bought several ants from them and each time have received excellent customer service.

I tried very hard and one firm would not send it to me outside the US! I
have a friedn in New York who posted it onto me.

Let us know if any company is willing to ship in outisde US and what it
costs as I have some friends who want to buy one as well

1171. Re: What is trunking...

Newsgroup: rec.radio.scanner
Date: 2003-01-25 23:44:25 UTC
From: Wayne Farmer <usenet@endymionsystems.com>
Message-ID: <1WWdnQ-wubFVvK6jXTWcqw@psknet.com>
Source record: 37954

You might find anywhere from 5 to 30 or so frequencies assigned to transmit from the central repeater to all radios. (There are also additional frequencies allocated to receive from the radios back to the central repeater station.) This is usually enough to support a large number of users, since you only need one frequency for the control channel, and one receive and one transmit frequency for each simultaneous voice transmission that you want to support at any given time.

Here's how it works in Motorola:

Each user with a radio can select a "talkgroup" that he wants to transmit on. This is just a logical channel name that a number of other users can share. For example, one talkgroup might be "Tactical Channel 2" for a city's fire department; another might be "Central Dispatch" for a city's police department. Each talkgroup has a 16-bit identifier. For example, say "Central Dispatch" is talkgroup 16400.

When the user with the radio tuned to "Central Dispatch" = Talkgroup 16400 presses his microphone switch, a digital message is sent from his radio to the central control system for the Motorola network. That system looks over all of the frequencies assigned to the system (the 5 to 30 I mentioned earlier) and picks one that is not currently in use, for example, 856.1450. (I suspect that if all frequencies are in use, it signals the user in some way.) But assuming that one is not currently in use, it then allocates that frequency to talkgroup 16400, and broadcasts a message over the control channel to all radios, telling them that talkgroup 16400 is now using frequency 856.1450. Any radios that have previously selected to listen to talkgroup 16400 will immediately be switched to that frequency. By the time the user who has pressed his microphone switch begins talking, all of the radios that wanted to hear anything transmitted on talkgroup 16400 will be tuned to his frequency, and will receive it.

When the user lifts up on his microphone switch, the central control system deallocates the frequency he just used, making it available for anyone else to use. It's quite possible that whoever chooses to reply to that users message will do so using a different frequency.

EDACS also uses a control channel and several voice channel, but I'll let somebody wiser explain the differences.

Is anyone interested in the scanner portion of a Scannocular?

The focusing rod on one side broke and fell off, so I tossed the broken binocs and have a perfectly good 100 channel, Alpha-Numeric display, 800 MHz scanner which has very little use and is in excellent condition.

Complete with antenna, manual, original box & packing, everything it came new with except the cheezy binoculars.

$40 shipped sound fair?

Jon

1180. Should I electrically ground my scanner?

Newsgroup: rec.radio.scanner
Date: 2003-01-26 02:44:30 UTC
From: bimmo <bimmo@attbi.com>
Message-ID: <3E334B8A.8050801@attbi.com>
Source record: 37963

Hi,

I experience an annoying, loud buzz when listening to the scanner. This is only the case when it is powered by an adapter in an house outlet. When used in the car, the sound is low-buzz free. Is this a grounding issue? I was thinking this because the magnetic (mobile) antenna "grounds" the radio to the car?

Thanks for any feedback.

1181. Re: Should I electrically ground my scanner?

Newsgroup: rec.radio.scanner
Date: 2003-01-26 03:05:08 UTC
From: Jon Van Allen <kf7yn@qwest.net>
Message-ID: <2fIY9.72$Sf4.79386@news.uswest.net>
Source record: 37964

The buzzing could be the power adapter you are using or from some other source on the same electrical circuit. Common sources of interference are computer and plasma displays, light dimmers, some types of light bulbs and lamps, power saving light bulbs, perimeter detectors, dusk/dawn light controllers, motorized power equipment, and certain appliances, etc.

Try turning off one circuit at a time until the noise abates. If it is still there,
try walking around the house with a small portable AM receiver tuned between stations. The buzzing will get louder as you get closer to the offending device or source.

The problem could also be a faulty step-down transformer or insulators out on the power pole, in which case a call to the power & light office is in order.

I found a noise problem in my neighborhood to be a neighbor lady's automatic dusk/dawn controller which was causing havoc over a wide range of frequencies. I approached her with an explanation of the problem and offered to replace the unit with an IR unit which cured the problem. She got a new controller and I got a quiet radio!

Hope that helps.

Jon

So do I. I have a PRO-2009 and it's very annoying, and the only way to make the buzzing dissapear for a bit is to hold the 'Manual' 'Search' '4' and '7' keys together. I really don't know why. Should I plug it into a 'cheater' plug? that way, there isn't any ground, but there isn't any protection if I accidentally zap it with static.

Help anyone?

P.S. I broke the real antenna, so I have a 100 cm Metal Whip antenna now plugged into the EXT jack. IT's loose too. but that's off topic...

Those frequencies are used to link different transmitters of a
simulcast paging system. You're hearing paging traffic.

Just bought a used BC780XLT. The first thoughts after turning it on included, boy this thing sounds cheap!

Guess I'm used to amateur radio equipment which has much better sounding audio and less hiss.

1. Is it common for audio from this scanner to sound so tinny (cheap)?
2. Does the scanner usually have hiss in the audio (mine does)?
3. If you are using an external speaker would you please tell me which one?
4. Is it worthwhile to install the discriminator mod?
In other words does this scanner have a good enough IF output?
5. Has any body else been driven CRAZY by the BACKWARD rotation of the squelch control??????
6. Lastly (for now!), are there any good web sites with links to MODS, discussion etc.?

Thanks,
Vic

I just got done helping a friend install a Radio Shack Discone in a 8ft attic in a two story house up on a hill. We used 50ft of 75ohm coax and adapter with a BNC fitting. Hooked it up to a BC895XLT scanner. We were receiving alot of different frequencies. Not bad for a $65 dollar antenna. I guess it depends on the location and the height of the antenna and what kind of receiver you have.

>I doubt they are digital, but was pretty certain they were trunk channels.
No wonder my 800 monitoring always seems so spotty.

Spotty? Finding trunk channels doesn't make your monitoring spotty, it
makes it golden.

Since you've got a PRO-95, all you need is one Motorola control channel
stored into a bank, and then you can monitor all of the Motorola trunk
activity associated with that control channel. You don't need to program
the frequencies of the voice channels.

Store the frequency of your "truck engine" into the first channel of a bank
(address 000, or 100, or 200, etc.). Set the bank to Motorola mode, and set
that first channel into Motorola mode as well. You can check to see if that
first channel is really a Motorola control channel by going into Manual mode
and looking at the channel; you should hear the truck engine noise, and the
4th line of your display should say MOT: CNTRL. If the Motorola system has
voice activity going on, you should see CNTRL change to numbers every so
often.

Now press SCAN and enable scanning of the bank you stored your control
channel into. You should begin to hear the voice activity, and their
talkgroup IDs will display, along with the frequency of the voice channel
being used.

Don,
I think you've done a great job and I thank you for your work andthe apps!!! That said, I understand about not being able to release the source code.

If there is anyone else who could and would be willing to provide the .spg import/export source and what the hardware is looking for before the import/export occurs I will do a Mac Version as Freeware. I'm looking for a fun objective-c side project. I don't know how many people would like a Mac version but I could do a nice OSX native version. I would also be willing to add additional file formats as the application matures. Anyone interested? If so, please contact me offline at:

other things to be found there are "auditory enhancement" units.
One example is the units used by some movie theatres to provide wireless
receivers for the hearing impared(other systems use IR or magnetic
induction).
Telex makes many of these systems, but others do too.
I believe these freqs are also used for wireless mikes.

Dan, I believe that hams stole that term from the maritime industry.
The very first installations of "wireless" aboard ships consisted
of small wooden shacks built on the decks to accomodate this new
fangled gear and the operators. The term "shack" followed those
radiomen even after space was made for them below decks.

audio and less hiss.

Well, better to have the case filled up with important electronics
than a speaker, I suppose. ;)

> 1. Is it common for audio from this scanner to sound so tinny (cheap)?

Mine sounds OK, but I use an external speaker most of the time.

> 2. Does the scanner usually have hiss in the audio (mine does)?

It _should_ depend on the source. It's possible you've done the same
thing I did when I first got mine - run a search and save the frequencies.
With close/strong stations, the 870 will often stop during search before
it's actually _on_ the right frequency, so I wound up with several stations
that sounded crappy but weren't properly tuned. Next time you're listening,
hit MAN when a poor station comes on and then manually tune it in using the
knob; you may find it's a little bit off-frequency.

> 3. If you are using an external speaker would you please tell me which
one?

I'm using a Cobra with noise-cancelling; the real little RadioShack
speaker is good, too. The bigger RS speaker doesn't sound so good to me.

> 4. Is it worthwhile to install the discriminator mod?

Yes people are using them as expensive as they may be. I know someone
in my area that just bought one and is listening to four or five different
localities.
He is already having problems adjusting his scanner so that it picks up both
their
voices without being garbled. Once he gets one locality adjusted clearly it
throws
the other one off and the others are garbled!

But for the purposes of what we're talking about here, it would be perfect to keep the neighbor from listening in. He would only notice a complete dropoff in phone traffic from the target. He wouldn't notice the spread spectrum signal.

Don't forget the 10 meter repeaters and the simplex frequency. I have them
programmed into my scanner as kind of a propagation alert.

The frequencies are:

29.600 Simplex
29.620 Repeaters
29.640 Repeaters
29.660 Repeaters
29.680 Repeaters

I went in to get a coaxial power connector that I needed and couldn't find
anywhere else, and the stupid guy wanted to sell me a cell phone, even after
I told him I already have one. He then proceeded to ask me who I had
service with and if I was happy with it.

If I had cell phone service through Radio Shack, I don't think I'd ever tell
anyone. The name "Radio Shack" seems to be on the same level as "Mattel."

Thanks for the advise. I just bought one. A little better deal on ebay and
they will ship internationally for a few bucks more.

Sounds like poor filtering in the wall wart, or else the filter cap has gone
bad. Try another one and see if that helps.

I don't think any wideband scanners have that function. You need a
shortwave receiver.

Ok now what about a good mobile antenna. I've used many mobile antennas over the years but have always gone back to the Grove magmount mobile scanner antenna. Its well over 10 years old now and after quite a few rebuilds its finally falling apart.

Any suggestions??

I have the following for trade. Looking to trade for a Realistic/Radio Shack DX 390, Sangean 818, and or a Uniden Bearcat 895 XLT. Will also consider selling, all reasonable offers considered.

1. Radio Shack DX 402. Same radio as Sangean 505. Box and manual. Mint condition.

2. Panasonic DR 49. This is the European version of the Panasonic RF 4900. In great shape except band switches stick. Also clips for wire antennas are missing so I'm including a a NASA PA 30 15 foot wire antenna that terminates in a coaxial PL-259 lead in that connects to the coax connector on the back of the radio. Antenna comes in it's orginal box. Very good SW reception with included antenna. Also included is a new power cord and a copy of the manual. Except for the switch problem radio is in great shape.

3. Realistic Astronaut 8. This large multiband portable dates from the mid 70's. Bands are AM,FM, SW from 1.8-22 kHz. VHF low, VHF high, and the airband. Radio has been cleaned and the telescoping antenna replaced with a new antenna. Has BFO. In great shape and dial lights work. Has S meter/battery strength indicator.

Email me for more information.

Thanks,

Dan Schopp

Dennis,

I just installed an antenna 'splitter' in the truck so the vehicle's outside antenna can serve to feed the AM/FM radio *AND*
scanner. It was quite a bit of work to install it ... had to remove some of the dash but it was worth it.
http://www.grove-ent.com/CPL63B.html

I have never run a separate mag-mount mobile scanner antenna so I cannot compare how the splitter performs compared to the
mag-mount, BUT one nice thing about using the splitter is you run STEALTH (there is no hint you have a scanner)!

1241. Amber Alert on Weather radio?

Newsgroup: rec.radio.scanner
Date: 2003-01-26 20:17:31 UTC
From: Cubit <no@no.not>
Message-ID: <vnXY9.97$do5.19797153@newssvr21.news.prodigy.com>
Source record: 37931

In San Jose, California I just got two "Warning" level alerts because of a kidnpping in Los Angeles over 500 miles away.

The weather radio can display "Statements," "Watches," and "Warnings." They chose a full Warning the same as a tornado warning. I feel this is a missuse of weather radios.

People who have weather radios are not on the roads watching for bad guys.

With regular false tornado warning alerts, the usefulness of weather radios will be gone. People will turn them off. A similar alert was on my weather radio about 6 months ago and I wrote about it here. That alert woke me up during the night.

There are many other places where amber alerts can be spread. However, weather radios are for disaster warnings where the listener's life may be at risk.

Last time, I was chastized by overly hormonal women who think we should have a nuclear missle alert and air raid sirens whenever a child is missing. Where is the common sense?

Source record: 37926

We have a system on 72.98, if I remember the frequency correctly. It is licensed for Base Station use only (no mobiles) and is used as a City Disaster Net. These base stations are in use at places like the Main Police HQ, the Mayor's office, the Emergency Operation Center, etc. These are for voice, not data.

The radios on this frequency are Motorola MICOR and GE MASTR II Base Stations, and run about 35 watts output power.

I picked up a used GE MASTR II 72-MHz Repeater station some time ago, on 72.100 MHz RCV / 75.540 MHz XMIT.

Message-ID: <3E344907.3080306@attbi.com>
Source record: 37927

Hi,

I really think this must be a grounding issue, since I tried different adapters in different houses, all the same deal; has a buzz to it that I do not experience with the antenna placed on the car. I called radioshack and they suggest that I make my own ground, by connecting my antenna with a lead wire to a copper pole burried in my yard... (so far for you've got questions and they have answers...)
Do those desktop scanners come with an adapter that is grounded? Do they have plugs with three prongs at all?

Thanx for the feedback.

1246. police Motorola TP100 a trunked system?

My friend, Officer Friendly, has a Motorola TP100 radio he carries with him. On the top there's a knob with selections 1-15. I asked him where are the frequency numbers. He said their former units had that, not these.

My question concerns my upcoming purchase of a scanner. Is this a "trunked system" and will popular handhelds by Icom and Yaesu be able to still deal with it?

what are the commonly used tac freqs, other than Tac 1 (159.1350) and Tac 2 (159.1950)? the old "car to car" channel used to get a lot of use, but the freq. was changed to 153.9650 and doesn't seem to get much use.

once source of Metro freqs lists a lot of tac channels, so I'm wondering which of them are in common use.

> magnetic (mobile) antenna "grounds" the radio to the car?

Before suspecting the wall wart, have you consider the noise is
from a local source in your house? You don't hear it in your car
because your car is located elsewhere? Have you removed the antenna
to see if the noise persists? If it does, then yes, it may well be
the wall wart... or something generating a lot of noise on that house
circuit wiring. If the noise goes away, then its likely to
be something in the house or nearby radiating an interferring signal.

>Are there any voice transmissions in this band?

In some areas, YES.

North Carolina Highway Patrol still uses 72 and 75 MHz frequencies for some of the links between their eight comm centers and remote sites.

Some of these links, though, have been relegated to "secondary" status as the state has extended its microwave system.

Even in a secondary status, hobbyists can still listen to the links - if you are in a lobe of their signal paths - to hear mobile transmissions over a wide area.

To NCHP's credit, they run their mid-band links with tone squelch, allowing hobbyists to filter out unwanted data signals on the frequency.

South Carolina Highway Patrol also has a couple of pairs of mid-band links in place to work remote sites, but I have never heard the link in my district in use.

A similar question came up awhile back. If I remember correctly, there was a fire department in Rhode Island, and another in central Pennsylvania, that used mid-band for linking their dispatch channel to a remote site.

Bimmo,

I'm not sure exactly what your problem is. It could be a problem with the power adapter, it could be a problem with the scanner itself, or it could be a problem with the cord/connector.

But, I would suggest that grounding is NOT the correct solution.

Nobody that I have heard of has ever had to resort to grounding to resolve such a problem. I expect that nobody on these boards has, in fact, ever grounded their scanner.

I suggest you look elsewhere.

Walt

Agreed. Grounding is not usually required. Certainly wouldn't hurt anything, just a probable waste of time and effort.

For the record, most times I have seen a problem with a scanner generating hum on receive, and powered by AC, was due to a faulty capacitor in the on-board power supply filtering section of the scanner. For most people this would require a visit to a scanner service department.

1258. Old analog dial VHF/UHF type radios

Newsgroup: rec.radio.scanner
Date: 2003-01-26 23:04:02 UTC
From: muse <b@x.c>
Message-ID: <mvo83vcrrb1ka0vm4ma5m6bff1ohs3o4h8@4ax.com>
Source record: 37941

I remember in the day my father had an old vhf/uhf type
radio that he used to listen to air and police comms on. It was
analog with a tuner wheel like a cheap am/fm radio. It was very
easy to find things as you just turned the dials till you came to
an active sound. These digital scanners and programming channels
seems like such a chore at times. I would like to have
a radio once in awhile that I could just grap a knob and turn
for fun. So, is there such a beast? A wide-band uhf/vhf analog
tuner radio. Are there theoretical limits as to what bands an
analog radio could tune to? Is it possible to make an analog
radio that would tune to the gigahertz range? The thought
has always intrigued me. I know some digital radios have
a semi-fake wheel turning function, but it takes forever to
tune just thru a small frequency range. A quick tuning ratio
would be nice occasionally.

Yes, there were radios like that 30 years ago. I used to own a PRO-3A which was a three band tunable radio. There was an Ebay auction recently for a PRO-2 which was the two band version of the same radio. Regency and Lafayette made similar radios and they are occasionally found on Ebay as well.

1263. FS: MINT Yaesu FRG-9600 Receiver/Scanner

Newsgroup: rec.radio.scanner
Date: 2003-01-27 01:03:07 UTC
From: klarrg@aol.com
Message-ID: <20030126200307.06598.00000259@mb-fh.aol.com>
Source record: 37945

I am selling my nearly-new, MINT condition Yaesu FRG-9600 communications receiver/scanner.It is absolutely flawless (not even any DUST on it!)and has all accessories as from the factory (except for wire tilt-up stand).This unit has probably been used for an hour AT MOST since was bought new a few years ago, and has been in storage since.
Radio covers 60-960 Mhz continuous (no cellular block)and has 100 memories in 10 groups of 10.The flourescent display is bright and the radio is in PERFECT working order.Purchase price includes the radio, power supply, antenna, box, packing, owner's manual, and OPTIONAL, INSTALLED TV ADAPTER ACCESSORY (allows radio to receive video signals thru a monitor (monitor and cabling not provided).Adapter was an additional $139 at time of purchase.
This is probably the cleanest, nicest FRG-9600 you'll ever find so, if you have been seeking one of these units for your collection or radio shack, this is THE one.This radio sold NEW for well over $700.00
You can own it for $400 plus $18 insured, double-boxed S/H fee.Payment by money order only, please, and radio ships to you SAME or VERY next day M.O. arrives here.Please Email any questions to me directly: ALL serious replies answered.Sorry, but NO trades or "offers". Can NOT accept PayPal, online credit, or personal checks.THANK YOU.

Fred Hambrecht Sr <v39142mu60u0f3@corp.supernews.com>...

^ I am sorry that you were disturbed twice in six months by
^ children that were so inconsiderate as to get kidnapped.

His complaint is justified and I share it. Crimes of any sort and individual life at risk's have nothing to do with emergency weather notifications. It was an unnecessary and wasteful misuse of emergency notification systems. It will not help in locating any person and it can actually hurt (as Cubit described) more than it helps.

^ Did you not consider that this is the fastest way to get the info to all
^ news organizations?

I considered it and it may actually be one of the slowest methods of notification. News organizations over the years have optimized another primary means of event notifications that the police use regularly.

A couple of things, you implied that your radio was grounded through the mag mount antenna.. It is capacitivily coupled to ground, not DC ground.

Grounding the wall wart would not do anything as the output is transformer isolated from the input.

I would check the canner in the houe under battery power, even if I had to drag a car battery in the house.

You did not say if you had tried another adapter. What is the current and voltage of the one you are using?

It is difficult playing guess the problem with out all the data.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed

3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises http://www.grove-ent.com but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists.

Uniden sells refurbished scanners dn you can check current inventory at their web site:
http://www.uniden.com/docs/store

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine, published by Grove Enterprises, http://www.grove-ent.com

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat

models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120
Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel

lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner

models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the ICOM IC-R2, Uniden/Bearcat BC3000XLT, and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered at your local Radio Shack store. Each Radio Shack store has a book containing frequencies and stock numbers. The crystals are mailed to your home within 10 days.

You can also order scanner crystals from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.

Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.
tel. 716-768-8151

Jan Crystals
Box #-6017
Fort Myers, FL 33911
tel. 941-936-2397

Monitor Crystal Svc
124 W Walnut St Watseka, IL 60970
tel. 815-432-5296

Short product summaries for over 70 scanner models appear in
a separate article, entitled "Scanner Radio Review Briefs."
You may share information with scanner collectors via the
"vintagescanners" mailing list at:

Muse,

I also like the capability of analog tuning on the VHF/UHF bands. The problem is that when you tune a digitally synthesized receiver across these bands, the tuning steps are so large that you probably miss some of the action. And the steps have to be large or else you'll spend 10 minutes tuning the band, and still probably miss the action. But the old analog receivers allowed one to tune rapidly (as fast as your wrist could spin) across the entire band and if you immediately heard a "pfsssst" while tuning, you'd know it was a signal and you'd stop at it the see what it might be.

Now I'm not knocking the digitally synthesized radios (I own a Yaesu VR-500 and love it) but it's a different mind-set with them compared to the analog types.

The Yaesu-Standard VR5000 has a tuning knob, tunes from maybe 50kc right on up into the microwave region, US models have a cellular hole in the 800mc range. It's not the greatest HF receiver, and not the greatest scanner, but it is just about the best combination unit in it's price range, under $500. http://www.universal-radio.com/catalog/widerxvr/0050.html R&L has them for $470. No connection to Yaesu, just a satisfied user of this model. My PRO2006 and FRG100B sis unused since this unit came into the house.

No, what I am saying is the burnt crumbs on the bottom of the toaster acts as a detector. While you may consider that ridiculous, a perusal of the Ham hobby literature from the AM days will produce a hoard of anecdotal evidence.

Did you try applying some contact cleaner to the band switches?
Does it also have a preselector?

Ditto. His complaint is, indeed, justified. Weather alerts are *not* the
correct way to go about alerting the population to anything other than
severe weather. Any other use will dilute it to the point that it's
useless.

I am very keen to get hold of a PRO-92 Version 1.00. Must be in good condition, and the seller must be willing to ship to Australia at my cost.

I am willing to pay a reasonable price for this scanner, but it must be a PRO-92 V1.00 Cat. No. 20-522.

1283. Re: Las Vegas Metro Tac freqs.

Metro only has two valley wide tactical channels. tac 1 and 2. They do
have several tactical channels that operate in simplex, but you'd have to be
within a few hundred ft. to hear anything so they are pretty much worthless.

Yaesu FT 757 GX
Pyramid PS 36K power supply
President Lincoln
Astatic 575 power mic
Shakespear army stick
Shakespear pogo stick
2- stainless steel whips
100 feet of LMR 400 coax
RG 8X coax, unsure how much i have, but it all goes
Radio shack amplified speaker
Lightning surge protector

I would like to trade for a high end base scanner. Everything listed goes as a package.

Everything works great, the lincoln is only a few months old, bought it brand new. The Yaesu was checked out by yaesu last summer. As per usual the buyer pays the shipping, I am not sure how I would ship the antennas.

Any questions, please feel free to email me @ freebird@cableone.net

Thanx for checking out my post; Charles

I have to agree, Amber Alerts on Emergency Weather radios is a missuse
of the system. If they start doing it in Florida I will turn off my
weather radio. I have it on for a reason, to know if we're having a
tornado in our area at 2AM when I'm asleep. There is no way that I"m
going to get out of bed to look for a kid at 2AM if the weather radio
goes off because of an Amber Alert. Just how many others are really
going to get up at 2AM for an Amber Alert --- NO ONE! If that makes
me sound cold hearted then so be it but if you believe that people are
going to be getting out of their beds and leave their homes at 2AM as a
result of their Weather Radio alarm going off for an amber alert then
you must believe in Santa Clause.

You will need to find out which dept. he is from and whether or not that is trunked or conventional. Not sure on that type of radio and I'm not about to spend the time to look it up, but just because the radio is trunkable doesn't mean that it is.

For example, officer Friendly (probably cousins) in my area of the country uses a trunked radio, but his radio also has conventional frequencies in it as well.

One quick way to find out what band he's in is by looking at the size of the antenna on the radio. Smaller the antenna the higher the frequency he is probably using. Again, this will just get you into the band he's on. You'd still have to find the frequencies by asking around in your community or internet.

Maybe it's the part of the country where I live in (Las Vegas), but we could get two rat's asses about what our weather is like over here. Anyways...I have a question for all of you who live in the COUNTRY of California.

When an AMBER alert comes through on the weather radio is it a message that continually repeats or does it give the AMBER alert and then proceed to give weather updates and then repeats AMBER alert, weather updates, etc?

If it's the latter I wouldn't find that too bothersome even if I lived in a city where there is more weather events, but having a continuous message of the AMBER alert and no weather information would really piss me off.

Just for more information. Every radio will have frequencies programmed into it. If he is trunking then his department is making better use of allocated frequency space. They're able to reuse frequencies and give more options to their end users.

A great way to find out is to check around on the net to see if any information is posted about the system then you can know if it's trunked system or not.

In any case, it is also possible that they went to digital communications in that case you'd have to buy the Bearcat 250d or 785d digital scanner.

If I were buying a scanner today, I would go with the Bearcat 250d. It's portable, relatively compact, has alpha tags, and it's powerful. It also has the ability to upgrade to digital communications as well. be aware that certain digital baud rates won't track correctly though using this scanner.

Just for the collector!

"Up for auction is this Bearcat III FM Monitor police scanner. This scanner is in operating condition! On a scale of 1(Bad) - 10(best) this is a 9! This scanner is in the original box! This scanner comes with the following crystals installed154.10, 155.01, 155.97, 162.40, 153.92(esc.2), 155.340, 155.490(bearcat), 155.595(esc.2)MHz. This scanner also comes with AC/DC cords, Original Receipt(dated 1979-cost $142.37-bought in Fairfax Alabama), Authorized Bearcat service center card, Bearcat 220 Advertisement, Receiver warranty card, Call for action card(to get the local FRQ's), NOW scanner club Membership application, Bearcat III FM Monitor Receiver operator manual, and the original box. What a find. I currently do not have pics but should soon. MISSING antenna. I had another antenna from a scanner just like this one and tested it. It works! contact me with any questions! Thanks for looking!"

The first mass produced scanner was the Radio Shack Patrolman. It was a small size am/fm radio with VHF highband coverage. You tuned all three bands with the little tuning wheel. The first VHF & UHF was the Patrolman 3 which was a large table top unit and you could tune by wheel either a vhf or a uhf frequency. As to your question about GHz, I just bought an AOR AR8200 MK3 that goes all the way up to 3 GHz and you can direct enter frequencies. Has a 1,000 memories also. Gill

Additionally when using power adapters be sure to use the correct center positive or negative. If you're not sure whether positive should be in the center or outside look at the diagram next to the power input.

Most newer weather radios have S.A.M.E. encoding (Specific Area Messenger Encoding). Those are those data bursts at the beginning of an EAS alert. It's sent three times in case reception is bad. It encludes the county code (which you can get at the Noaa Weather radio site), the alert type (Tornado, Flood, Civil, Tune TV), and the length of the alert (2:00 hrs for whatever).

You can program what county you're in (and soon it will divide counties, i.e. Southeast/Northeast, etc) and most newer radios, you can select the alerts you actually want to be alerted to. If you could care less about a flood, you can lock out off flooding related alerts, and your radio will not even turn on.

Weather Radios right now issue alerts under the Civil Emergency (CEM), soon there will be a a new code specifically for Child Abductions Alert (CAE). I keep CEM on because if there ever is a plant explosion that doesnt wake me up, it will turn on let me know if I need to take appropriate action. Weather Radio will also let us know if there is an extreme danger should war ever start.

Would you know where to purchase a radio that only alarms you when the Counties you select are effected? We did have 1 weather radio but the alarm would go off if the bad weather was 4 counties away so we stopped using it.

The best way to set your scanner optimally for listening is to divide your scanner banks into 10 groups of 100 channels.
Then set each bank up to cover 1/10 th of the way to oakland. Then you have the entire distance covered.
Save the last bank for oakland itself. It is helpful to enter an "alpha" for the last bank that says "Oakland", so you can tell that you are listening to oakland.

Finally, if you plan to travel with your scanner, you should increase the sensitivity of your antenna to accomodate what is called "scope drift". This enables radio frequencies to be compensated for as the movement between you and your target increases or decreases. A serious drop in power can occur without sufficient signal to base ratio aspect. You should NEVER altimate any of your reciever's banks without proper gain resolution on the negative side.
Enjoy your new hobby.

Joshua Carroll <br3Z9.11535$1z1.1302995@twister.austin.rr.com>...

^ You can program what county you're in (and soon it will divide
^ counties, i.e. Southeast/Northeast, etc) and most newer radios,
^ you can select the alerts you actually want to be alerted to.
^ If you could care less about a flood, you can lock out off
^ flooding related alerts, and your radio will not even turn on.

So weather radio is no longer weather radio, it is now a national emergency notification system? The National Weather Service did so well at fulfilling the needs of its subscribers that its service has been commandeered by other government agencies? As a consolation, they continue to broadcast weather reports during times when there are no emergency bulletins?

While rereading this I changed all periods to question marks but I don't really expect answers. I think the only solution to the problem is to change the label from Weather Radio (or whatever the official name is) to National Emergency Notification System - VHF Radio (with weather on the side). Weather radio no longer exists.

Frank

I have only heard the Amber Alert once on my weather radio , & that was just a test . That was several months back . I don't mind the alert if it would help save the life of a child . As far as getting out at 2 am searching thats what the police is for. If the Alert gives details of the missing childs clothing description ..height..weight..etc then it does give the public notice to be on watch in case the child is spotted Those who complain would probably think different if it was their child who missing .

Fred,

Can you suggest any sources of articles on this topic? It sounds like ham urban legend to me, but I would be willing to accept it if I read a reasonable account of it from a reputable source. I would think that it would be easy to select something from the "hoard" of evidence available.

What do you think the first receivers consisted of? Those that Marconi
and his fellow workers used. Do a search on "coherer" and see if you
can find some info. The earliest receivers would make a toaster look
sophisticated! And don't forget all those people who hear radio
stations with their teeth (actually their filling and caps).

I used to have a Wards Airline radio with analog tuning. Had so
much fun listening to the police. Once you know where the xmission
are, you can mark the dial to go back when ever you want.

There is one of those radios on auction on e-bay right now.
Just do a search for "Airline Radio". Don't know if it has the
needed band(s) for your area, but I do know that it picked up both
VHF hi & low.

Message-ID: <aAcZ9.31104$QV3.3563228@news2.west.cox.net>
Source record: 37896

I have all my scanners set up this way:

Bank1: ALL conventional Fire freq's in my county
Bank2: ALL conventional PD freq's in my county
Bank3-10: Trunked systems for trunked agencies in my county.
Bank 11-20: Misc aircraft, state govt, federal, etc. (not all my scanners have this many banks, but a couple of them do...)

In the trunked banks, the talkgroups are organized into agencies. List 1 is PD, list 2 is City works, etc. (none of the cities that use trunking here are using it for the fire department - yet)

In banks 1 and 2 all are locked out except the ones for my area of the city I live in. The rest I can quickly tune to and/or unlock when I'm mobile.

Police Call mentions this technique as the Un-delete method. If you don't have a copy, pick one up and read the section at the front of the book. Lots of good stuff in there for newbies.

...Another fallacy. Just because you smear a signal across the
spectrum doesn't mean it will go unnoticed. It will raise the noise
floor if nothing else. There is no power control system from base to
handheld telephone, IIRC. AFAIK, IANAL, part 15 does not mandate that
one should exist. YMMV :-)

Part 15 spread spectrum devices are allowed to use up to 1 Watt on
928-952 MHz with a minimum spread of at least 500 kHz. You won't have
any trouble detecting that with a scanner. If all goes well however,
you should only hear noise. But don't count on it.

IIRC, Panasonic GigaRange phones seemed to have a problem with their
early spread spectrum being quite detectible with a scanner.

Go to your local library and dig through the QST's and 73 Magazines from the 50's to the early 60's. You should find a number of stories from the AM days.

I use to have a dipole that came within 6 foot of the ground at the ends when I was a kid. One of my buddies was also a ham and he would talk on my radio while I went in the yard with a pencil. Holding it by the wood part I would draw an arc from the end of the antenna and listen to him talking in the arc.

I was talking on the radio one day and my mother, who had see me do this a number of times, went to show a neighbor. She had failed to note the subtlety of holding it by the wood. She grabbed the pencil by the metal end and got knocked on her butt. Needless to say I received a ration over that.

There are a number of cases of people picking up strong AM signals via the fillings in their teeth. You can imagine the consternation when you started hearing voices in your head and didn't want to tell anybody about it! :>)

Just buy a CB whip, short out the coil, and make the total length of the antenna the length you'd need it for whatever band you're listening to. If all you want is 800 MHZ, a cell phone antenna would work well. It may even work well on lower UHF bands.

Here is one you may not know about, Lucille Ball was instrumental in capturing a Jap spy during WW2.

In Warren G. Harris' 1991 book, "Lucy & Desi: The Legendary Love Story of Television's Most Famous Couple," the author states:

"...Lucy's greatest, if most unusual, contribution to World War II happened by accident. While driving home from the dentist after having several teeth filled, she suddenly heard noises coming from her mouth that sounded like Morse code.

As soon as she got back to Desilu, Lucy reported the incident to the police, who referred her to the FBI. An agent said that ner new dental fillings might have acted as a receiver. Could she please take him to the exact location where she heard the noises?

The FBI started an immediate search of the area surrounding the spot that Lucy pointed to in Coldwater Canyon. Several hours later, investigators found a transmitter hidden in a tool shed. It turned out it belonged to a Japanese gardener who was part of a spy ring operating up and down the Pacific Coast."*

(Note: When Harris mentions "Desilu" in this story, he is referring to the Arnazes' San Fernando Valley ranch, not the studio/production company -- which was not founded until 1950.)

He wasn't asking about the step size, but the bandwidth. The Yaesu VR-500 can tune in steps of 50 Hertz and not only that, but has a CW mode! It alsow receives SSB, AM as well as Narrow FM and Wide FM signals. It is powered by two AA cells. I don't have the manual so I don't know the current draw, but it isn't much. I don't know the bandwitch in CW mode, I doubt that it is different from the bandwidth in SSB mode, but I don't know for sure. The small tuning increments certainly would help in getting the proper tone. However, it may not work very well in a crowded band.

With a receiver this size, you're going to have to accept some compromise and lack of variable bandwidth (ie. no CW filter setting) is one of them.

1322. FAMILY RADIO SERVICE INTERESTING LISTENING.....

Newsgroup: rec.radio.scanner
Date: 2003-01-27 19:35:38 UTC
From: ultimixxjams@yahoo.com
Message-ID: <91e64058.0301271135.7e26a1a1@posting.google.com>
Source record: 37805

Hi All:

Im running a Bearcat 895XLT scanner on an outdoor scanner antenna. Latley I have heard some interesting traffic on the family radio service freq. If you have a good scanner and outdoor antenna program in the following freqs.

CH - FREQ.
01 = 462.5625
02 = 462.5875
03 = 462.6125
04 = 462.6375
05 = 462.6625
06 = 462.6875
07 = 462.7125
08 = 467.5625
09 = 467.5875
10 = 467.6125
11 = 467.6375
12 = 467.6625
13 = 467.6875
14 = 467.7125

If you live in a city or near a highway, you will hear some pretty interesting traffic on these freqs.

For example I now my neighbor a few doors down bought his mistress an FRS radio so they can communicate.

Some kids were breaking into cars in the neigborhood using FRS radios to communicate with the lookout. The poor thief gave out the street they were hitting and yeah they got caught.

Just a couple of examples, try it out and see what you here. And yes Im aware this nothing new, Im sure some of you already have this information. This post is for people who dont!!!!!!!

1323. ONLINE SCANNER TRAFFIC SINCE 911

I have a discone antenna and I can pick up UHF and VHF frequencies better on a normal wire. Is this normal or should I check antenna's coax? I just don't know how well discone antenna works and how much signal is it supposed to pick up, so no way to compare, thus wondering.

What about 29.500? I thought that was a simplex frequency too?

Yep, FRS seems to be the new way for kids to communicate these days (barring mobile phones). Sure makes those 49 MHz walkie-talkies seem archaic. I remember having a GE 49 MHz walkie-talkie which came with a base-station of all things. The walkie-talkie and base-station were capable of sending/receiving morse code and the base-station had a code practice function. The base-station also did triple-duty as an AM radio

and CB receiver.

I got this thing back in 1982. I was 11 years old and living in Canton, Ohio at the time. I did alot of AM DXing on the base-station. The school buses in Canton were using CB radio back then and I listened to those alot on this thing.

Ahh, a chance to nitpick. My life has meaning again.

Some wall warts can handle multiple input voltages. The Radio Shack
DX-399 SW radio is sold with a wall wart that can handle any voltage
from 120 to 220, and it even comes with a plug adapter. Nice, very
nice. If you're in Europe, a wall wart or power adapter converts 220
volts to whatever the wall wart's output is. Wherever you are, a wall
wart takes the stuff coming out of the wall and turns into a form that
your radio or scanner or whatever can use.

Hi All,
Does anyone know if there is an after market NIMH rechargable battery made for the BC200XLT? I see where I can get replacement batteries for my BC200XLT, but would like an NIMH battery as they tend to last longer. I once even saw a battery pack that opened up and you could put batteries in, but I have no idea where to get one. Any suggestions?
rgds,
Mark S.

Uh????.....

Anyway, go to Ham Radio Outlet in either Oakland or San Jose and get copies of "Government Radio Systems". One is marked "Golden Gate Region" (green cover), another is "Ca State Agencies (red cover), and yet another is "Federal Agencies" (tan cover). The same author also has a book on trunked freqs. all through California (yellow cover?). All are 81/2 by 11 books. There are also books on Central Coast, North Coast, Central Valley, etc by the same guy. By using his books, I just programmed a 1000 channel scanner for traveling the coast from Mendocino down to Monterey counties, plus CHP, DOT, Marine, St. Parks, GGNRA, CDF, etc. BTW, I'm up in Concord. The afore mentioned HRO's, sometimes carry different books as they serve different areas. Hope this is of some help. If you don't see'em in the store, just ask, they're very helpful. Plus they may have other books that'll help. Welcome to the hobby!!! Eric

There's a yahoo group dedicated to the future release of the first Radio Shack digital scanner. It will be have the same design as the Pro-93/95, but with many more enhancements, a few include open-mode ID lock-out, FIPS for weather radio, 150 trunk IDs per bank (50 more than current scanners), manual ID hold without waiting for the ID to appear, and it's fully digital ready (no add-on-cards needed).

Price?? Go to the link below...

http://groups.yahoo.com/group/RS_GRE-Digital-Scanner

(NOT spam, just information on a new scanner)

Whether it relives the noise problem or not, you can never go wrong
by grounding. A really good ground is a 9 foot copper pole hammered
deep into the earth. Some hams actually will do this in parallel and put
about 5 rods in the ground and connect them to their radios in parallel.

Frankly you can never ground too much!

Back in the good old days we did stupid stuff, but we took responsibility for doing so and did not attempt class action lawsuits against any and all for failing to anticipate our stupidity.

The answer to your question was 75 watts input to the final stage. No idea what was getting to the antenna. These were the days before we had watt meters, swr meters, and all manner of things, that today allow us to measure misunderstanding, with great precision.

Did you listen to the recorded message? Why don't you tell people the entire message spoken by the lady? Are you afraid of the truth? She clearly states that there would be opportunity for people if the Palestinians would honor a cease fire agreement, but they cannot even do that. They simply don't want peace. They want to push the Jews into the Mediterranean Sea and have all of Israel, particularly Jerusalem, for themselves. You, my friend, are an anti-Semite. Thanks for clarifying the definition for the world and giving a perfect example of how you'll lie to smear the Jewish people.

Okay, I'm not familiar with this model, but I thought ebay killed auctions of equipment that monitored cell phones.

It is interesting that in his list of frequencies, he skips 824-851 and 868-896. To the best of my recollection, these are the cellular mobile and base transmit frequencies, respectively. So much for continuous coverage. It sounds like this guy just conned someone in to buying a radio that doesn't work as advertised! At a minimum the advertising seems to disagree with itself.

Sorry, posted the above message while drunk - with a few shots of
whiskey, the message becomes hard to understand. Now with coffee,
it all seems clear.

As for the original question, connecting scanners with a T tap will
degrade signals by 3db. shoudn't be a problem, though.

Connecting with a splitter will typically cut your signal strength by
4dB. Using a T splitter is more problematic. Aside from signal loss
due to impedance miss match you can have interference between the
scanners. Just what it will be is highly dependent on the scanners
involved.

Hi,

In theory it can, but due to the short transmission range of cellular phones you have to be almost outside the house when the call is made. The same would apply to PMR radios (446Mhz) short range means you almost need to be in sight 2-3km when someone is talking.

radio <waver03@yahoo.com> wrote in article

Does that mean a analog scanner will not be able to scan that frequency?

There's no need to search that wide a range. Look here
http://www.fordyce.org/scanning/genfreq.html for the exact frequencies you
should be searching. Use the base frequencies rather than the mobile ones
(they are 45 MHz lower than the base freqs)...you will sometimes hear both
sides of the conversation this way if you have analog activity in your area.
Much of the cellular activity is now digital.

I managed to ghetto rig my tv tuner into a simple reciever/scanner using a piece of 20 gauge speaker wire, a 1' strip of oem coaxial cable (unknown gauge), and a coat hanger. Right now I can intercept the Nws(?... Its whatevers playing on 159 and 162mhz) Maritime Report for the Chesepeake Bay, some radio traffic from a local train station on 149mhz, and your average joe stations (99.1/100.3/97.9). I plan on building a better antenna tonight with some taped/soldered coaxial cable strips, but I doubt how much better the signal is going to be. What can I do to improve the reception quality? Any help is welcome.

One, no currently manufactured scanner sold in the US is allowed to scan
the cell frequencies, also here it is a crime to listen.
2nd. The frequencies you 'could' scan were of the older analog cell
phones.(ie bag phones, the old flip phones, and many of the newer phones
when they cannot find a digital signal).

How do you put a price on a piece of scanning HISTORY?

It should go on an auction site if you ask me (which you didn't, I know). Then people can make offers and curious folk like me can see how much it goes for.

At least let us know what the highest offer is when you sell it. I gotta know. That radio is priceless, in my opinion.

By you and me, probably not. But somebody who has a scanner just so he can listen to his neighbor's phone probably won't notice the difference. At any rate, what would it matter? He wouldn't be able to listen in with his scanner.

Believe what you want, but the facts are a different story.

Prove it to yourself. Take a DSSS spread spectrum phone from the base
and go for a drive to a different neighborhood. See how many bases
respond. See how many conversations you hear.

You're not as safe as you think. But go ahead and convince yourself
that the naked emperor is wearing clothes. The rest of us will have a
pleasant laugh at your expense.

While you are scanning, press the decimal key and you will see it toggle between banks and talkgroup lists. Once you know you are in banks, press 2 and you will also be scanning bank 2.

Take your scanner to a theme park or any large public event and there
will be so much traffic you can't follow it all.

99% of conversations go something like...

"Where are you??"
"Over here..."

Anyway...it does make for some interesting listening.

Swell. In a few months, they'll be marketed as "Emergency Notification
Radios" and you won't have to owrry about the subject anymore. In other,
simpler words, they won't BE weather radios anymore so you can stop moaning

about the corruption of weather radio 'cause theyt won't exist. I long for the day.

My father in law, an electronics engineer by trade, put it to me this way when I was experiencing this problem:

"Imagine that the buzz you are hearing was slowed down, so instead of a continuous buzz you hear: bzt... bzt... bzt... bzt... Now if you listen to the bzt sound closely, you'd discover each bzt was your scanner saying OUCH."

The moral of the story is that your wall wart is causing your scanner some pain, and if you ignore it, you might damage it. Pitch the wall wart in the garbage and go get a universal one from Walmart or Rat shack. I bet that solves the problem. Solved it for me!

Hello. Sorry for the cross post, but since this has to do with both antennas and monitoring, I figured it was appropriate for both newsgroups.

I wish to monitor a trunked system that operates in the 406 - 410 mhz range. I currently have a VHF/UHF discone at 15 feet fed with 50 feet of RG-8U (from Rat Shack- ugh). I'm using a Pro-2053 to monitor it. I can pick up other frequencies originating from the same place in the 140 and 160 mhz ranges, but I'm not hearing any of the trunked system. I know the system is active and I should be hearing something.

I am about 25 miles straight line distance and my house is about 40 feet above sea level. Can anyone suggest why I might not hear the 400mhz system? Would boosting the antenna higher help (I could get it about 10 feet higher)?

You can scan the frequencies all right. You just won't be able to
understand/decipher anything of the transmissions you may receive.

Just had a email from Antenna Warehouse, their content was:

"These antennas have a big problem with getting damaged by the carriers
here in the States. I fear it would be even worse if we attempted to
send one overseas."

Start looking in Australia again for something better than a discone.

At 15 feet high your radio horizon is about 5 miles. If you are 25 miles
from the trunking antenna then it is necessary for the trunking antenna
to be about 200 feet high.

If you raise your antenna to 25 feet then your horizon increases to
about 7 miles and the other antenna would need to be about 165 feet.

Sounds like it's not going to happen. You won't be able to hear the
trunk.

Metro West went out of business several years ago.
The Pro Pack 1200 is awful. It only has 1200mah, last 1-2 years and cost about $60.00 and requires a special charger. You can get a 1650mah NiMH pack(no memory efects) for $52.00 in the same size case and uses original charger. call 800-722-3326 or see the website:

>
>Deacon Dave, W1MCE

So then trunking systems vary that much from conventional systems? As
I stated, I can hear transmissions in the 140's and 160's coming from
the same place, but none of the trunking. How does the type of antenna
work into this equation? How do you come up with your numbers?

I can hear the state police on their 800 mhz trunked system no problem
with the back of the set antenna and I am sure their antennas are much
farther away than 25 miles. I can hear a 400 mhz conventional system
that is about 30 miles north of me with the back of the set antenna...

Better yet, why didn't you just replace them with NiMH? They'll last even longer and give much better quality.

I believe http://www.bills2way.com will sale you a battery pack for the 250xlt for much less than what E-Crapbay can find you.

My suggestion would be to go to the actual antenna and verify there are ACTUAL 400 mhz transmissions coming from it. If you do hear it then continue trotting with your horse down the road until you no longer hear it anymore. Bring along a GPS receiver and deduce from that information (altitude, distance, etc) where you are losing the signal at.

You're done..

Video formats would seem to be more productive than an audio formats such as radio etc.. Giving a description of a child such as height, weight, hair and eye color (as well as race) narrows it down some, but if you gave a description of " caucasian male, 4 foot 2 inches tall, about 80pounds, brown hair and eyes" is still kinda vague as I could probably find at least 100-200 in my county of about 90,000-100,000 that match that same description. Video or print would suit the Amber alert much better. As far as which channels on tv or cable get "interrupted" is a different argument.

>
> Weather radio is no place for such an alert. Those alerts are for weather
> related emergencies only.
>

Weather emergencies, as well as any other disasters, natural or man-made seems to be the only necessary uses of that system. Possibly attacks/war related stuff may be useful too.....

Furthermore, I would eliminate that antenna from the equation. Can't you just use a regular stock antenna that came with the scanner to get a lock on those 400 mhz signals? Try that and find out what frequencies they're operating at first before trying to figure out problems with your antenna.

> PDW and have his source code. Can someone confirm he is really deceased -
> seemed like a young guy? I would really need his permission to post the
> source since he owns the copyright and I respect that.

You're absolutely right! PDW is great software, better options and usability than WinFlex or other software. But there are just some little things that I'd like to fix, such as:

- FLEX group paging (Short Instruction Vector)
- Better filter managment
- bigger window for better visabilaty
- warning when entering duplicate filters
- search option

And maybe some other options...

I really hope that someone can find out if he's 'still alive'.....

Hi All: I was looking at Uniden's Web site and noticed these two digital scanners. They are rather pricey.

Q: Are they any good?

I have a BC 200XLT that I have had for about 10 years. It still works but not as good as it did when new.

I noticed that the digitals require an extra card to monitor digital systems?

Q: I think this card is an extra $300+ ?

Anyway, I always felt that the 200XLT was poorly made. I have had to repair the antenna connection several times and I am lucky the thing still works after all of the soldering that I have done to the antenna connector.
Before I invest in several hundred dollars for a new scanner I would like to know that the quality is better than what I have seen in the 200 XLT

I'm only replying regarding the antenna heights required based on the
info you provided. If the trunking system is different, i.e. closer to
antennas or antenna heights vary, then the answer is different.

Radio Horizon miles [VHF/UHF] = 1.4 * SQRT[antenna height in feet].

Hi Andy,
is the trunked system an analog one and working on fixed frequencies ?
If it uses the spread-spectrum technology, it appears as slight noise
on your scanner. If it uses digitized speech, it appears as QRM of
some sort.

1444. Lock-out on Regency Z series

Newsgroup: rec.radio.scanner
Date: 2003-01-29 15:31:22 UTC
From: JFR <jfr.mail@club-internet.fr>
Message-ID: <b18sbp$883$1@news-reader12.wanadoo.fr>
Source record: 37777

Hello,

I bougth a Z45 Regency scanner without any user manual and I can't find how to use lock-out feature : I found how to set
time and alarm, memory use and channels allocations, programming limits for search mode, using speed function in scanning mode and delay/hold features.But what I can't find is how could I lock a channel : the scanner memory kept old channels in memory, some of them are locked and "lock" lights on display : lock-out feature exists, and I think it's limited to programmed channels (like many "soft price" scanners, lock-out in search mode is not available).But... the trouble is there is NO lock-out key... I tried many combinations possible and I can't lock (or unlock) a channel.

Could you tell me how the lock-out feature works on this model ?

Thank you !

Best regards

it's an analog system on about 15 frequencies or so. The scanner is set up to properly receive the system. I currently monitor another more local 500 mhz trunked system.

Why is it that trunked systems apparently have shorter range than standard systems? The other transmissions that I've heard from the same place are repeaters in the 140 and 160 mhz ranges and they come in strong. Why wouldn't a trunked system act the same way? I understand that 400 mhz has shorter range, but I can hear a 400 mhz standard system (medic dispatch frequencies in the next county up) that is located about 30 miles north of me with the antenna on the back of the scanner.

Source record: 37780

This scanner gives you direct access to more than 31,000 frequencies including
police, ambulance, ham radio, and transportation services. You can select up to 200 channels to scan, and change your selection at any time. The secret to your
scanner's ability to scan so many frequencies is its custom-designed microprocessor - a tiny, built-in computer.
Your PRO-62 scanner can receive all of these bands:

30-50 MHz VHF Low
50-54 MHz 6-Meter Amateur Radio
118-136.975 MHz Aircraft
137-144 MHz US Government
144-148 MHz 2-Meter Amateur Radio 148-174 MHz Government (Local, State, Federal)
380-420 MHz US Government
420-450 MHz Amateur Radio
450-470 MHz UHF Low
470-512 MHz UHF-T Land Mobile
806-823.9875 MHz Conventional Systems
849.0125-865.9875 MHz Conventional/Trunked
866.000-868.9875 MHz Public Safety
894.0125-896.000 MHz Aircraft Passenger Telephones (AM)
896.0125-960 MHz Trunked

> respond. See how many conversations you hear.

Most likely, none. If your phone handset is out of range of your base, it won't do much because it's waiting to hear the signal from the base. It doesn't just go into a receive mode where it can pick up anything on the same frequency. And it won't access another base unit without hitting the same access code, which usually changes each time the phone is lifted from the base unit. The chances of hitting the same code number are astronomical.

1452. continuing buzz problem (chapter2)

Newsgroup: rec.radio.scanner
Date: 2003-01-29 19:04:37 UTC
From: bimmo <bimmo@attbi.com>
Message-ID: <3E3825C4.7030306@attbi.com>
Source record: 37785

Thank you all for the feedback.
First, here are my specs for the experts out there:

scanner: Radioshack pro-2066
wallwart: Radioshack 13.5v 1000mA
antenna: Radioshack mobile magnetic mount

problem:
There is an annoying low-frequency buzz, only when scanner is powered through wall-wart in ANY house outlet. This is NOT the case when scanner is directly powered through the cigar-lighter in the car.
It doesn't have anything to do with the antenna, since the noise is there, whether it is connected or not.
It is NOT a ground issue (like you experts pointed out) because the scanner does NOT make the buzz in the car. (even without the antenna connected, and so ruling out the antenna possibly grounding the scanner...)
It can't be the wall-wart since I tried 2 old ones, AND I just bought a brand new one, as listed in my specs above, with no difference.

One of you suggested to drag a car battery in the house, but I'm going to keep that as a last resort, for now, assuming that the problem is a disturbance in my electrical circuit in the house.
Now,
many of you suggest that this noise could be due to a dimmer, computer, and so on... Does this mean that I have to get rid of all my dimmers, computers and monitors in the house? There must be more of you out there that have dimmers in the house and computers running when listening to the scanner...

Isn't there a practical solution to this? (other than running the scanner on a car battery in the house) For instance, is there something like a "special" power adapting unit that has goodies like noise filters and/or stabilizers in it that would help this?

As usual, any feedback is greatly appreciated!! Thanx a lot.

Sounds like mains hum - I get this problem too. It's worst with the radio set to AM and tuned to low frequencies, say 15MHz and below. I've never done anything about it since most of the time I run my radios from batteries, but I reckon you could solve it (or at least improve matters) by adding suitable decoupling capacitors and chokes to the output of the power supply - might be worth having a look at the output of the PSU (while it's supplying power at its DC output) on an oscilloscope to see how "rippley" the output is.

Or maybe not!

Phoned Stridsberg yesterday, talked with them about their 'active' multicoupler.
http://www.stridsberg.com/prod01.htm

Found out they just had a price increase, approx. 9%. A four port coupler will sell for around $176 ... WOW! I looked around and
they can still be found for $155 or so, BUT, isn't there a less expensive way to couple more than one scanner to one antenna?

Got to thinking (which I try not to do often), why couldn't I buy a multi-port, wide band, ADJUSTABLE GAIN, low noise *TV*
amplifier???

Would only be a fraction of a Stridsberg multicoupler!

Pro's or Con's, please ...

Vic

Hello,

I recently purchased a Radio Shack Pro 95 scanner and have been very happy with it. I was wondering if anyone could recommend an indoor antenna that would give better reception than the one that came with it. I don't have the opportunity to mount anything outside. Any recommendation and/or links would be appreciated.

Thank You,

Chad

The construction seems much more firmer. If you had problems with the antenna connector then you may have problems with the connector on the 200d. I owned the 200xlt and now i own the 200d and have never had a problem with the antenna and I traveled with it everywhere. In and out of the car, etc. I guess I just take care of my more to prevent it from bending, putting pressure on it, etc.

Robert, just wondering if you have the need to monitor digital, non-encrypted systems in your area?? If so, the 250D and 785D are the only game in town for now. I've heard rumors that Rat Shack might be coming out with their digi-scanner later this year, for about $500.00, if you want to wait that long. If you don't have any digital systems to monitor, you can get by with a much cheaper VHF/UHF scanner.

By the way, I just received my new BC 250D last week. Got it mostly programmed up and have several of the features down pat finally. Its too early to tell, but it seems like it does everything Uniden says it should do. I live in southeast Michigan and have been listening to 2 different digital systems as well as a bank of conventional mixed VHF and UHF freqs. Handles them well and the receive got better with an aftermarket antenna (rubber ducks suck). Lotsa scanner for the $$$, but lotsa $$$ for the scanner (ouch) !!

I can use my PC TV tuner to roughly scan non TV channels. I think if there
was software designed to do this the process would be easier

Hi,

I bought an old BC860XLT at a garage sale for 5$ and the display works, and I have audio but I'm not able to receive anything. Is there a trick to this radio someone can help me with, or do they just go bad after a while? I can program in channels, but never receive anything...

Thanks for any help you can provide... Paul

Some of the old Regency scanners set lockout by entering the channel number while the radio is scanning.

1) Check that the center pin in the base of the antenna isn't broken off - they're known for that...

2) Check that the antenna connection inside the radio hasn't broken - common in Radio Shack units, possibly occurred here...

At any rate, it sounds like you're not getting the signal, although it's possible that something failed electrically.

Is this the 10 channel or the 30 channel? If the 30 channel, there's a mod for 80 channels I can pass on.

Thanks for your reply, I'm still stumped. This is the 100 channel scanner. I checked the antenna connections, and they are fine. It looks like a clean radio inside, and no signs of being messed with before. Hardly looks like there is much to go wrong with it. I thought maybe I was doing something wrong or there was some programming I missed, but there is no signal even when I can hear one on another scanner.

Any other ideas would be welcome!

Thanks again,
Paul

RS/GRE Digital Scanner In Works!
Posted on 01/25/2003 14:38 EST

We recently received the following information and after talking to
the program manager of the project to help ascertain its credibility, we
offer the following for your enjoyment:
I work with a team of engineers who is assisting Radio Shack and GRE
with the development of Radio Shack's first digital trunked scanning
receiver. We are very excited about this radio and thought your readers
might be interested in knowing a little bit about it.
The user interface and receiver are built around the very successful
PRO-93/95 radios, with some significant enhancements:

a.. The radio has 500 channels in 10 banks of 50 each
b.. There are 150 trunked IDs per bank, in 5 ID sub banks of 30
each
c.. Users can perform "open mode lockout" - lock out undesired new
or existing IDs while in open mode, a great tool for catching new
talkgroups!
d.. It is now possible to perform manual ID hold without waiting
for the talkgroup to become active
e.. The radio will track UHF and 800 MHz Project 25 9600 BPS
Control Channel systems!
f.. The radio will track all Motorola 800 MHz splinter system
types
g.. Users can now edit the Welcome screen, just like the PRO-92
h.. Full FIPS/SAME NOAA weather radio capability, with 10 FIPS
code slots
i.. A new FRS/GMRS/MURS search range
j.. A temperature controlled crystal oscillator (TCXO) is used to
ensure frequency stability at all temperature ranges - very important for
digital!
k.. There is a revolutionary, patented scanner memory management
system - you'll have to wait for details but trust me, it will be a very
popular feature!
l.. There are some control channel analysis tools that users will
find very beneficial, again, you'll have to wait for full details!
m.. The radio will be a handheld scanner similar in size to a
PRO-93 or PRO-92
One of the most exciting things about this radio is the digital DSP
decoder system!
a.. The radio is fully digital ready - there are no add on cards
to purchase
b.. The radio will decode any digital system that is compliant

with Project 25 Phase 1 - essentially this means no VSELP, but all ASTRO
IMBE and P25 digital modulation types are supported
c.. There is a really cool DSP feature that I can't give details
on just yet - but you will know it when you see it in the manual!
d.. No special quality settings are needed for different digital
system types - you can scan different systems in the same or different bands
simultaneously without changing digital quality settings
e.. The cost is expected to be in the $499 range, and the radio is
expected in stores around November 2003.
So there you have it. Sounds like quite the revolutionary product and
a new direction in scanner design! It sure looks like Uniden won't be the
only game in town for long and it will hopefully breath some life into
RadioShack's lean scanner product line.
We thank the gentlemen working on this project for sharing this news
scoop with us and hope to hear more about this product in the near future!

Here in Denver I had a battery company replace the cells, cost like $20.00 and it works great.
Look up battries in your area and call around, it's the best thing to do.

Does anyone use this antenna? Is there any way I can mod/cut it to get better 800/900Mhz reception? I have about a 15 foot length of RG-216 MIL-C-17 grade coax running from it. I usually have it hooked to a Pro-2045 base, and might use it on the Yupi 7100 also. I have considered getting some RG-6 and seeing if that makes it better. Any advice on tweaking this antenna would be appreciated. Thanks!

==========

Remove the 2 elements that stick out at an upward angle
and cut the rest of the elements to 3.3"s. That will give you
a good 1/4 wave ground plane antenna for the 800-900mhz.
It will actually be resonant at 850mhz cut like this but it will
be good enough.

Jeff

Trunked systems are designed much like cellular systems, each transmitter
covers only a small area. Then, the frequencies are reused. And, if the
coverage area is well defined, the nearer sites may well have directional
antennas aimed away from you.

In the 800 MHz range the phones transmit 45 MHz below the repeater output. For example a cell phone would transmit say on 830.025 MHz then the repeater would transmit on 975.025 MHz. In digital cell phones there are more frequencies in the 1800 MHz to 2000 MHz than there are in 800 MHz. Cell phones work much different than public safety systems. Frequencies are reused several times in a county. A digital scanner will not pickup digital cellphones as they do not use APCO25 modulation. Of course it is a violation of federal law, a serious felony as of last legislation to monitor cellphones. Gill

Well, if by some miracle, the PDW project is resurrected from the
Code Graveyard ... the first thing I'd request is support for hardware
decoder (2/4-level FSK interface) under Windows 2000/XP ... !

Either that, or can someone figure out a way to get COMPRT.VXD
to work in 2000/XP (perhaps replacing the VXD with a modified ver
or by adding a "shim" driver interface between COMPRT.VXD and
the OS)?

For the time being, I have to run a dedicated Win98 box for PDW :(

I can dream, can't I ...

Andy:

Well, dB gain is dB gain. If 10 dB is needed to make the path work, and the antenna has 10 dB of forward gain, then yes.

You are asking a question like:
1. "How much water will it take to fill this bucket if I hold it in my right hand?"
2. "How big's the bucket?"
1. "I dunno."
2. "Well, however much it takes to fill it, that's how much it will take to fill it, whether you hold it in your right hand, left hand, or put it on the table."
and so on.....

See the problem?

Try checking your connections coming from your service drop. Maybe hire an electrician for a couple of hours if you need. If you do involve an electrician call ahead and describe the problem so they can send someone capable and with the right check out gear. Keep an eye on him he might not know what he is doing either. Ask questions . (yes they are in every facet of life :-)) Check the grounding wiring connections for tightness as well as the condition of the bond between the center tap of the secondary and ground. Check the resistance between the white service conductor and ground or cold water pipe. It should be little or 0 but definitely less than 25 ohms. The center tap on the secondary is where the white or neutral wire is connected to in your residence. I have seen a similar condition occur on a music sound board and it turned out to be caused by a ground loop and your description sounded very similar to what happened to us. I have also found annoying 60 cycle buzz being induced in radio gear from fluorescent lighting over 6 ft away from the radio. Proper grounding made the problem go away.

Let us know what you find.

Mike Burch K8MB/7

Apache Junction Arizona.

Bud,

It might help if you start off with minimum acceptable offer. I know how this sounds, but in this group I think it would be lucky to fetch $500. Even with it's history and features, it's a hard sell in this market - scanner guys want bigger better faster cheaper. Look how many people bitch about the 250D's price tag, but I'll be damned if it's not worth every penny and then some...

This is a scanner for die hard collectors. Average joe (the majority of this NG) can't comprehend the value of such a thing.

I agree that $150 is a joke but we have to start somewhere. So talk it over with Cindy and work out what the bidding should start at. If I had the money, I'd tell Cindy to name her price, but like you, I can't afford it either, especially with a shiny new 250D in my hot little hands...

"Amber" was the name of the kid the Amber Alert system was named
after. BUT... the first time it was used in southern California,
many, many people thought it was related to the colors used in the
national threat levels, which it is not. it is not, I assure you, a
pleasant sight to see "Amber Alert" on a freeway traffic information
sign and spend the next few moments wondering if Los Angeles were
under attack.

But lets expound on that for a moment...

Think about how cell phones work. They take a standard size analog channel and send data packets over it, much like the now monitorable APCO25 systems.

Cell phones - even digital ones, can be had for next to nothing. So what's to stop someone from taking a tapped scanner, a PC and the decoding circuitry from your standard CDMA digital cell phone and connecting the dots????

I'll leave you with that happy thought. Any more comment from me might be..... actionable.

here's mine...if you have a mil air capable scanner, try the Nellis AFB bombing range frequencies, usually before noon. when they're active (controllers, aircraft, spotters), its like evesdropping on a private war. if anyone is interested or might add to the list, let me know.

Just wondering if there are any handheld scanners that can also be configured to work like a pager such as MINITOR II. That is can they remain squelched until a particular two tone signal is received on a specific frequency?
TIA

Put it on eBay, with some photos, list it's heritage and features, and let the market place decide.

check the USCG website at:

http://www.navcen.uscg.gov/marcomms/cgcomms/rtchan.htm

an R7000 will have no problems monitoring these freqs. start with the
USCG at 5696 where they talk to rescue helicopters. Freq may be quiet
depending on who gets into trouble.

I think the deal is that weather releated events kill much more people than
any predators. If there is an alert going off for AMBER and a family
doesn't hear an EMERGENCY ALERT notifying them of a tornado in the area,
then who just became a victim? The "system" for emergency broadcasts was
designed to save countless lives for weather is now being replaced for AMBER
alerts. I'm going to venture so far as to say that a situation where an
AMBER and Weather alert in the same area probably hasn't caused a death as
of yet, but this is something that needs to be looked into so a missing
person tragedy doesn't cause a larger tragedy when a tornado touches down
and nobody was notified accordingly.

Isn't it odd that while wailing that they're being pushed into the sea, the
Israelis keep grabbing more and more land? Isn't it odd that the American
people are financing the endless dispossession, torture, and slaughter of
indigenous peasants by colonialists?

Oh... that's what the yanks did to the indians isn't it.

Well, then, let's use Weather Radio to do a thirty-second description of
a missing child every eighteen seconds.

Weather Radio is for weather.

Our local Radio Shack is now taking orders for the Uniden BC-250D with the BCi25d digital decoder. The manager says the Dallas/FT Worth warehouse has them in stock with a 10-12 day delivery time. $701.98 each!!! Ouch!! But sounds like quite a radio.

It is just a simple ground plane with no gain what so ever.

While not as pretty, you could make one that works equally as well from a connector and a piece of copper wire.

There are any number of simple to build antennas that would run circles around it.

The Israelis aren't grabbing more and more land. They've tried to give it back. However, they've had to move back into some areas because the militant/terrorist Arab groups are based there.

Come on, it doesn't make any difference that the US has supplied Israeli forces with weapons. If it wasn't the US, then it would be another nation, France, Soviet Republic, China, etc..

There's no denying it, the US does have a bloody history. However, I would like to know of a particular influential nation today that does not have a bloody history. For all it's worth, I doubt that region of the world will see peace any time soon. Call me crazy or idealistic, but the only way that region will see peace until there is joint government where Israeli and Palestinians have an equal voice and are afforded equal protection under its laws.

Hi all,

I want to connect a discriminator signal to either the earphone or ext.
speaker connector of the UBC2500XLT to decode digital signals.

Where do i find this discriminator signal and what is the best approach to
do this?

Thanks,

Ton.

Do you have internet access?

Go to a search engine and enter cellular phone frequencies.

This works for cordless phone frequencies, and just about anything else
you need to know as well.

You mean they "protectify us" like the Dalkon Shield prevents
unwanted pregenancies and fuel tanks in the Ford Pinto and
saddle-mounted GMC Pickup were "100% Safe" in the
event of a car crash?

Oh boy whoop-diddle-dee-doos I feel much better already!

> Be glad for them and tune in to 3860 LSB every night at 8pm to find
> out the real truth from these great Americans.

...more like Glad-baggie wrapped AmeriKKKans - grin.

The night before last "Orange Blossom" came up on 3.860 LSB
[without the benefit of a proper FCC issued callsign I may add]
and informed the assembled bib-overalls wearing masses
that the USAF was in a "live fire aerial dogfight" over Mexican
and USA (Texas) airspace with Russian and Cuban MIG's.

This all had something to do with illegal
aliens [...from the planet Remulac ?] allegedly
crossing the border to pick or pack lettuce and
cucumbers in crates for Texas growers...I think.....
it was a rather surreal moment you see.

Guess what, these nitwits on 3.860 believed it!
But then again what do you expect from a pack
of fools who thinks that Alex Jones and Jeff Rense are
accurate sources of news and information? I bet they
really miss Art Bell too - grin

Oh well, enjoy these RF militialoon clowns on 3.860 now before
their each hoisted up by their own pitard from paranoid
stupidity, thus ensuring by their own from their actions
when they go the way of David "boylover" Koresh, Tim "OKC"
McVeigh, William "pale of horseshyte" Cooper, Steve
"Col nutcase" Andersen and shoebomber Richard Reid.

Yup, 3.860 LSB from 8-9 PM! It draws em in
just like rednecks flock to an NASCAR

or Earnhardt #3 memorbilia show. Plus more
bootleggers too using fake callsigns - just like that
KB8--- what checks in nightly
and don't appear on qrz.com or the FCC database....

Hmmmmmmmmm..... (*ring* Hello...FCC..?)

1550. Adding to the BC780 Comp. Interface Knowledge Base

Newsgroup: rec.radio.scanner
Date: 2003-01-31 19:34:04 UTC
From: martin@okstate.edu
Message-ID: <b1ej3caje1@hydrogen.cis.okstate.edu>
Source record: 37583

I want to contribute to the body of knowledge about computer control of the BC780XLT. My thanks to those who wrote a good document on much of this family of scanners and how to roll one's own computer control of them.

Since I have had my BC780, I have successfully gotten everything to work under computer control except for trunk-tracking and CTCSS lockout.

Today, I finally figured out how to do CTCSS lockout and here is how one does it.

First a bit of background. The computer commands are always sent in upper case and a good many of them are two letter codes followed by the carriage return. The BC780 either responds with OK if the command worked, NG if the command is good but not appropriate such as asking the 780 what channel it is stopped on while it is still scanning. And there is also ER which is the BC780's way of saying, "What?"

To set a PL or CTCSS tone via computer port, involves stopping the scanner on 1 channel such as going in to Manual mode.

Let's say we are stopped on Channel 25. Channel 25 has a cement company that uses CTCSS tone 30 plus a private detective agency that would be interesting to listen to if it wasn't for all the chatter from the cement trucks.

To set an ordinary CTCSS tone, one would type

CS030 <enter>

and the scanner should reply OK.

Unfortunately, that enables the CTCSS tone that the cement trucks use and blocks out magnum PI who has no tone for some reason.

All you have to do is to put a L as in Lockout after the tone frequency.

CS030L <enter>

does the trick. You may hear a very tiny blip of sound when the concrete company starts to communicate, but it is almost too short to notice.

Another test you can do is to open the squelch all the way and hear the noise. If the tone you are blocking comes on, the squelch suddenly closes until the tone goes away or is covered by a stronger signal without the tone.

Now, if I can just figure out how to get the trunking commands working via computer. The example in the document I have is for a different

scanner and doesn't appear to apply to the BC780XLT.

1558. Collection of scanners for sale

Newsgroup: rec.radio.scanner
Date: 2003-01-31 22:52:25 UTC
From: nr3nde@aol.com
Message-ID: <20030131175225.29635.00000538@mb-mv.aol.com>
Source record: 37591

Hi All
I am selling my collection of scanners I have collected over 20+ years. Please e-mail me for a list of what I have. I would prefer to sell the whole lot at one time.
There are 53 scanners in this collection. I'd rather sell here before it goes to the "bay"
If interested, E-mail me

Thanks
Dane NR3N

> As usual, any feedback is greatly appreciated!! Thanx a lot.

Warning! possible B.S.

I have heard of this before and it was traced to the wall wart diodes used to
make
DC. evidently, the Diodes when they switch, cause the impedance at high
frequencies
to be modulated by the diode state. This would be like a antenna that changed

length
at 120 Hz, in this case it would be more like modulating the ground. The cure is to use a common mode (ferrite clip) choke or a well bypassed supply.
on the dc side. In away its like a ground problem.

Sounds crazy, and I am pulling this way out of the past and i am fuzzy on the details
and may be wrong.

Dan

1562. Frequencies used around Ft Dix?

Newsgroup: rec.radio.scanner
Date: 2003-02-01 00:13:06 UTC
From: spamme0826@yahoo.com
Message-ID: <8ddf3ec0.0301311613.77bf49bc@posting.google.com>
Source record: 37596

Can anyone tell me the frequencies used by the police, fire and EMS agencies that border Fort Dix? I know Wrightstown and Browns Mills border it, but I am not sure what else or even what frequencies they use since I couldn't find anything on an internet search. I assume that the state police might cover those towns, but would need to know which troops/talk groups cover those areas.

Please reply in the newsgroup. The email address is just a spam magnet. I do not check it.

Only in Yankeedom could Yankee-trained psychopaths have such a large
following. The other side also has a large following: Janet "girllover"
Reno and esp. Hillary "vayest raght waing conspirahcy" Clinton. Janet
was no doubt jealous of the Davidians. Either side is worthy of self-
-destruction by their own paranoia, lust, envy, and hate.

Most cell phones are digital now so unblocking a scanner is a waste of time. Besides, scanners made since the latest communications act was passed (1994?) can not be made to receive the cell band.

Trunking frequencies is basically a group of frequencies assigned to a large group of users. As a user keys his radio, it takes one of the open frequencies. After they unkey, the next time someone in his group keys, it might select a different frequency, depending on what's available. Basically it allows multiple agencies or departments to use less frequencies. A nice system until a disaster and then all the frequencies are being used and some users will be blocked from talking (this actually happened to me in 1998 during a helicopter crash at Ft Campbell KY). It allows agencies to assign priorities to different users so if all frequencies are in use, higher priority users can get on before others. It also prevents users from keying over each other.

It's also something found on an Elephant or typically in the rear of a car.

I would like to know what you can and can't post on a website that you record off a scanner. Can you post police call traffic? Fire traffic? Commercial and military air and ground traffic? Is it different from state to state are there federal laws about it? I see lots of websites that post all these things. Are they just getting away with it because law enforcement doesn't want to do anything. I am starting a website and I would like to know. Thanks

Piece of cake. Pull the top off the scanner, slide the light out of the slotted holder and carefully pull it out of the orange rubber housing. Unsolder it and take it down to the nearest Radio Shack and match it up.

Area 51: Bush Exempts Secret Base From Environmental Laws
By Leonard David
Senior Space Writer
posted: 09:35 am ET
30 December 2002

That super-secret Air Force base near Groom Lake, Nevada -- purported site of everything from captured aliens to the highest of high-tech aircraft -- has been exempted by President Bush from environmental laws that would disclose classified information regarding base operations.

President Bush's decision about Groom Lake was made last September and published December 24 in the Federal Register.

Groom Lake has been the target of litigation brought about by former workers at the base. That legal action focused on health effects resulting in the handling and disposal of hazardous wastes at the secret locale.

Area 51: For Your Eyes Only

Hackers Invade Website for Area 51 Images

Area 51 'Not Compromised' by Satellite, Pentagon Says

Area 51 Revealed, Judge for Yourself

Bush judged that "it is in the paramount interest of the United States" to prevent disclosure of information about Groom Lake.

The Presidential decision exempts the Air Force activity at Groom Lake, Nevada, "from any Federal, State, interstate or local provision respecting control and abatement of solid waste or hazardous waste disposal that would require the disclosure of classified information concerning the operating location to any unauthorized person."

The exemption shall be effective for a full one-year statutory period.

1586. Processor Serial Number (PSN)

Newsgroup: rec.radio.scanner
Date: 2003-02-01 07:00:17 UTC
From: Scanner Nut <fightfanNOSPAM@twcny.rr.com>
Message-ID: <5gK_9.8120$iK4.5236@twister.nyroc.rr.com>
Source record: 37669

What are the privacy problems with the proposal?
Intel announced on January 20 that it was planning to include a unique Processor Serial Number (PSN) in every one of its new Pentium III chips. According to Intel, the PSN will be used to identify users in electronic commerce and other net-based applications.

We believe that providing a unique PSN which can be read remotely by web sites and other programs in mass-market computers would significantly damage consumer privacy. This number is designed to be used to link users' activities on the Internet for marketing and other purposes.

According to Intel VP Patrick Gelsinger, the PSN will be used to identify users who access Internet web sites or chat rooms. He told the RSA conference, "unless you're able to deliver the processor serial number, you're not able to enter that protected chat room." According to Intel, the technology will also be used for authentication in e-commerce, which will attach the PSN to a person's real-world identity.

The PSN would likely be collected by many sites, indexed and accumulated in databases. Unlike cookies, which are usually different for each web site, the PSN will remain the same and cannot be deleted or easily changed. The advertising and marketing industries have been strongly advancing technical means of synchronizing cookies so that information about individual consumer behavior in cyberspace can be shared between companies. We believe that a hardware PSN used in the majority of computers would quickly be put to this purpose. The records of many different companies could be merged without the user's knowledge or consent to provide an intrusive profile of activity on the computer. The only solution would be to change the processor or computer. Because the US has few legal protections for online privacy, there are no practical limits on what can be collected or used. According to the San Jose Mercury News, Intel will rely on "the high-tech industry policing itself, upholding a voluntary code that restricts the amount of information computer companies, Internet service providers, Web sites and telecommunications companies can collect, and how they use it" to protect privacy.

With PSNs, any software running on a person's PC can obtain the PSN, and if the application is Internet-enabled, can transmit it anywhere. The user may be unaware this has happened. Given the widespread practice of downloading shareware, and the lack of legal protection over personal data and the economic incentives to collect and sell it, widespread abuse seems more than likely. Gelsinger also told the RSA conference that over 30 companies had already committed to Intel that they were planning to use the PSN.

We conclude that it is contrary to the public interest in privacy for chips with a PSN to proliferate widely into the consumer computer market. Given

Intel's dominance of the processor market, this would happen within a few months unless sufficient pressure were applied to Intel to disable the feature in the Pentium III. Intel stated that it plans to start shipping the chips within a matter of weeks, so it was essential to begin a campaign as early as possible after assessing the risk based on Intel's own statements.

I'm not sure of the meaning of most of the document, but I see the following
frequencies: 42.59 / 44.24 / 42.18 / 44.20 - see the retyping below.

And there are many sites for Canadian scanner info - wade thru these...

http://scannercentre.8m.com/canfreq1.html

http://members.shaw.ca/t-nano/Links.html

http://www.geocities.com/ipaidthebills/index.html

http://www.fordyce.org/scanning/links.html#ON

Found these by searching Google - "canadian scanner frequencies" -
do the same and see what else comes up

any scanner with an earphone jack can be adapted to respond to tone signal control. the tones activate an external speaker which will stay on until manually reset or reset after a programmed time limit. units and kits used to be available through scanner and ham outlets. Electronics magazines throughout the eighties and nineties featured construction and home brew articles. still should be easy to find with an internet search. These could be utilized to do a lot more than turn on a speaker.

900 antennas

The Omaha area scanner group did a informal comparison of different hand held scanner antennas at their meeting this month. You can see a chart
of the results as well as some pictures from the meeting at this link:

You're really sad. I bet after 9/11/01, you rushed out on the 12th and
bought every newspaper that you could so you could auction them off on
Ebay.

The shuttle exploding is not going to cause your auctions to sky
rocket.

What does your auctions have to do with scanners, anyway?

Actually I bet eBay will remove all Shuttle related items for 60 days.
That's exactly what they did after 9/11. eBay removed and didn't allow
any 9/11 or WTC items to be auctioned for 60 days (or was it 90 days, I
can't remember).

As with most shuttle missions I record the launch and landing audios
from the Shuttle Air to Ground frequency (259.7000 MHz AM). I just
put up on the www.MilAirComms.com website the audio I recorded of
Columbia's last launch - STS-107.

As you know Columbia was lost this morning. It happened just a short
time before I should have been able to pickup the actual comms on 259.7000.

You can listen to Columbia's Last Ride to orbit at
http://www.MilAirComms.com

1st of all, he is not religious at all, which is why Al-Qaida hates him, and would like to see him dead, since Iraq is the most westernised country in the Arab world. 2nd, Saddam gives Jews & Christians more tolerance than in any other Arab country. But Zionists, esp. those who claim to be Christians but are not, he hates, esp. Bubya. Even the National Council of Churches condemns Bubya for being a Christian hypocrite, and the message is delivered by Bishop Talvert from Bubya's own denomination in the Methodist church. Tune into KTBN or WWCR, and you'll probably hear those spots.

> CAN YOU IMAGINE THE HAY THAT SHORTWAVE
> RADIO BULL SHIT ARTISTS LIKE ALEX JONES AND
> JOYCE REILY AND JAMES LLOYD ARE GOING TO MAKE
> FROM ALL OF THIS.....??????????????????

Gov't trained kooks are bad enough. On VOR there was a report read from Pravda that a UFO was spotted over Iraq during the last Gulf War, and had to make a forced landing. They speculate that Saddam has alien weapons. No doubt the NASA-trained kook Dr Richard Hoaxland will be on Coast to Coast 1st thing next week to flog an even bigger magic bullet theory.

Will this unit have the ability for trunk tracking and APCO-25 decoding??
Seems somewhat useless for public service monitoring, if not...

73,
Ed NI6S

1624. Shuttle coms

10:00 PM Eastern Time
Saturday Night on or about
3.947 mHz LSB (could be anywhere
between 3.940 and 3.960 as they
have had to "hunt" fer a freq as of late)

Your right Carl.
There is an awful lot of sickness out there!
It makes me wanna PUKE

Just check out:

"SPACE SHUTTLE COLUMBIA DEBRIS" on E-Bay now!
